WARNING

ELECTRICAL HIGH VOLTAGE CAN KILL YOU

Electrical high voltage cannot be seen but it can kill you. Electricity is unlike most other dangerous things you can come in contact with because it gives no warning and no symptoms to be wary of. Its effect is immediate. It can kill you, render you unconscious, or severely burn you. To ensure your safety and that of other maintenance personnel, always observe the following precautions:

DO NOT perform any maintenance on electrical equipment unless all power is removed.

DO NOT perform any maintenance on electrical equipment that must have power applied during maintenance without proper insulation between you and the equipment at all times.

BE CERTAIN that there is someone assisting you who can remove power immediately.

ALWAYS place POWER OFF warning tags on power supply switches so that no one will apply power while you are performing maintenance.

ALWAYS make sure the unit is properly grounded.

FOR ARTIFICIAL RESPIRATION, REFER TO FM 21-11

WARNING

DANGEROUS CHEMICALS CAN KILL YOU

The chemicals used for operation in the ROWPU can kill you. Breathing some of the chemicals used in the ROWPU system can cause severe headaches, dizziness, loss of muscular control, a sleepy feeling and coma. Brain damage, eye injury, severe skin damage, or death can result from heavy exposure. The chemicals alone or in a mixture can be very dangerous without good air movement. These precautions must be followed to ensure safety when handling or mixing chemicals:

ALWAYS wear protective clothing while handling dangerous chemicals.

NEVER get too close to or breathe dangerous chemicals.

ALWAYS make certain that a good clean water supply is available to flush away any chemicals that might come in contact with the body.

BE alert at all times during operation for chemical odors and exposure symptoms. If either is present, IMMEDIATELY VENTILATE personnel compartments. If symptoms persist, remove personnel to fresh air.

WARNING

NOISE

Operating level of this generator can cause hearing damage. Ear protectors, as recommended by the medical or safety officer, must be worn when working near this set.

WARNING

Generator sets must not be operated in enclosed areas unless exhaust discharge is properly vented to the outside. Be alert at all times during operation for odors and exposure symptoms.

REPORTING ERRORS AND RECOMMENDING IMPROVEMENTS

You can help improve this manual. If you find any mistakes or if you know of a way to improve the procedures, please let us know. Mail your letter, DA Form 2028 (Recommended Changes to Publications and Blank Forms), or DA Form 2028-2 located in the back of this manual directly to: US Army Aviation and Troop Command, ATTN: AMSAT-I-MP, 4300 Goodfellow Blvd., St. Louis, MO 63120-1798. A reply will be furnished directly to you.

Marine Corps users submit NAVMC 10772 Form to Commander, Marine Corps Logistics Bases (Code 850) Albany, Georgia 31704-5000.

Approved for public release; distribution is unlimited

CHAPTER 1

INTRODUCTION

Section I. GENERAL INFORMATION

1-1. **SCOPE.** This operator's manual describes the Operating and Operator's Maintenance Procedures for the 600 Gallon Per Hour (GPH) Reverse Osmosis Water Purification Unit (ROWPU). It should be noted that although a complete 600 GPH Reverse Osmosis Water Purification Equipment Set is described herein, certain components are not issued under the National Stock Number NSN 4610-01-093-2380, but are authorized (Army) under their own TOE Line Item Numbers and are listed in the Department of the Army Supply Catalog SC 4610-97-CL-E16 which describes the entire 600 GPH ROWPU Set. NSN 4610-01-113-8651 is the Marine Corps ROWPU designation. For component list, Marine Corps personnel see SL-3-08580A. This SL-3 covers ROWPU model 600-1, serial number 1 through 338 inclusive.

NOTE

Paragraphs not designated Army or MC are applicable to both configurations.

1-2. **MAINTENANCE FORMS AND RECORDS.** Good maintenance records must be kept. Department of Army forms and procedures used for equipment maintenance will be those prescribed by DA PAM 738-750, The Army Maintenance Management System (TAMMS). Marine Corps personnel refer to TM 4700-15/1 for forms and records procedures.

1-3. **HAND RECEIPT.** (Army) A companion hand receipt technical manual has been issued with the ROWPU to aid in accounting for all of the end-item related equipment. The hand receipt manual is numbered with TM number of this manual (TM 10-4610-215-10) followed by "-HR". Hand Receipt Manual TM 10-4610-215-10-HR contains pre-printed hand receipts for Components of End Item (COEI), Basic Issue Items (BII), and Additional Authorization List (AAL) items. Additional -HR manuals maybe obtained from the U.S. Army Adjutant General Publications Center, ATTN: AGDL-OD, 2800 Eastern Blvd., Baltimore, MD 21220, in accordance with the procedures in Chapter 3, AR 310-2.

1-4. **REPORTING EQUIPMENT IMPROVEMENT RECOMMENDATIONS (EIR's).** If your ROWPU needs improvement, let us know. Send us an EIR. You, the user, are the only one who can tell us what you do not like about your equipment. Let us know why you do not like the design. Tell us why a procedure is hard to perform. Put it on an SF-368 (Quality Deficiency Report). Mail it to us at:

Commander
US Army Aviation and Troop Command
ATTN: AMSAT-I-MDO
4300 Goodfellow Blvd.
St. Louis, MO 63120-1798

Marine Corps personnel submit EIR's in accordance with MCO 1650.17.

Section II. EQUIPMENT DESCRIPTION

1-5. EQUIPMENT CHARACTERISTICS, CAPABILITIES, AND FEATURES

a. **Characteristics.** The ROWPU is a mobile water purifying unit needing a 30 kW power source, that supplies drinking water for troops in the field. (See fig. 1-1 (Army) and fig. 1-2 (MC)).

b. Capabilities and Features.

(1) Flow systems within the ROWPU process raw water to make it drinkable. Special pumps, controlled by a built-in control panel, move the water through the ROWPU to produce as much as 10 gallons (37.8 liters) of drinking water per minute. This water is stored in a collapsible tank that can hold up to 3,000 gallons (11,340 liters). The ROWPU can be transported by rail, road, or air.

(2) (Army) The flatbed cargo trailer and frame is designed to provide a mobile platform for the ROWPU. The trailer, when being transported by road, is towed by a towing vehicle through a lunette/pintle hookup. The trailer has four leveling jacks (round, Model No. 600-1) with swivels, one on each corner, and is equipped with a spare wheel and tire carrier. The trailer incorporates service brakes which are air-actuated and operated from the towing vehicle through an integral set of hoses. The trailer brake system also includes emergency and automatic parking brake functions that are activated when the air hoses are disconnected from the towing vehicle. An air tank is installed for the purpose of reserving air for this system when the trailer is disconnected from the towing vehicle. A 24-volt electrical system, consisting of one composite blackout-stoplight assembly, and two stoplight-tail light assemblies, is installed on the trailer. Power is supplied through a cable connected to the electrical system of the towing vehicle. The trailer suspension consists of two axles in tandem, supported on leaf springs attached to a trunnion axle. The frame houses the ROWPU and is capable of being separated from the trailer and transported or air lifted as an independent unit.

(3) The Army and Marine Corps units are essentially the same except that the Marine Corps' ROWPU is mounted on a skid and does not incorporate a generator.

1-6. LOCATION AND DESCRIPTION OF MAJOR COMPONENTS. The Army ROWPU is 18 feet (5.5 meters) long, 8 feet (2.4 meters) high, and 8 feet (2.4 meters) wide. It weighs about 8 1/2 tons (7.71 metric tons), including the generator set. Figure 1-3 shows the ROWPU from the top with its canvas cover removed. Take a close look at how all the necessary operating equipment is stored on the trailer for transport and shipment.

The Marine Corps ROWPU is 9.5 feet (2.9 meters) long, 5.6 feet (1.7 meters) high and 6.9 feet (2.1 meters) wide. It weighs about 3.65 tons (3 metric tons). Figure 1-4 shows this ROWPU from the top with the canvas cover removed.

a. To provide room for all operating components, material is stored in layers (fig. 1-3 and 1-4). The top layer consists of rolled-up (suction) hoses on top of two folded water tanks. Stored between the tanks is a sledge hammer and a collapsed telescopic aluminum paddle. Next to the tanks is a stack of five plastic pails with chemical names on their sides. On the same side of the ROWPU you will find two storage boxes fastened with a strap under the tanks. The boxes contain various chemicals, tools, and installation items. Nine sections of suction hose are stored on the side of the frame.

b. In the second layer you will find two raw water pumps and a backwash pump (fig. 1-5 and 1-6). The pumps are covered with canvas and strapped down. A distribution pump is located at the rear of the unit, next to the generator (Army ROWPU only), not shown here. Army ROWPU includes a portable step strapped down with distribution pump. On the right side are 1-1/2 inch and 2-inch diameter discharge (canvas) hoses, rolled-up. A raw water float is in the center of the ROWPU next to two nuclear, biological, chemical (NBC) cylinders. Figs. 1-7 and 1-8 show ROWPU with operating equipment removed.

Figure 1-3 Top View Of ROWPU With Operating Equipment Stored (Army)

NOTE

Illustration denotes Army Model No. 600-1, MC Models are skid- mounted with no generator.

- c. Fig, 1-9 identifies the following parts:

CANVAS COVERS (1). Protect unit from weather. Rolled up and strapped during normal operation.

CROSS BRACES (2). Give strength to ROWPU frame during shipment. Can be removed to get at equipment.

R.O. PRESSURE VESSELS (3). Four vessels which house eight reverse osmosis elements that reduce total dissolved solids from filtered water to produce drinking water.

R.O. PUMP (4). Applies high pressure to raw filtered water in R.O. vessels.

CONTROL PANEL (5). Panel with meters, switches, valves, and hose connections.

GROUND ROD (6). Driven into ground and attached to ROWPU to keep operators from getting electric shocks from power source or static electricity.

CONTROL BOX (7). Panel with switches to control all pumping and panel lighting.

GENERATOR SET (8). (Army) Provides electricity needed to operate ROWPU.

JUNCTION BOX (9). Contains circuit breakers, overload heaters, motor starters, etc.

- d. After you remove the equipment shown in fig. 1-10, 1-11, and 1-12, the inside of the ROWPU will be visible.

Figure 1-13. ROPU - Generator Removed (Rear View)

NOTE

Illustration denotes Army ROWPU, Marine Corps unit is skid-mounted with no generator or platform.

e. Fig. 1-13 identifies the following parts:

MULTIMEDIA FILTER (1). Provides first stages of removing unsafe matter from raw water,

R.O. PRESSURE VESSELS (2). Loaded with rolled, thin films (called elements). Here, osmosis is reversed by applying pressure to reduce dissolved solids from raw filtered water.

R.O. PUMP (3). Applies very high pressure to raw filtered water flowing through R.O. pressure vessels.

CONTROL PANEL (4). Panel on the control box assembly with meters, control valves, hose connections, and electrical switches.

CARTRIDGE FILTER (5). Provides more cleaning to water coming out of the multimedia filter.

PULSE DAMPENER (6). Located behind the cartridge filter, reduces shock (water pulses) caused by R.O. pump.

BOOSTER PUMP (7). Forces water from multimedia filter through the cartridge filter

GENERATOR PLATFORM (Army) (8). A 30-kW generator set is mounted on this platform

PRIME/RUN VALVES (9). Allows pumps to be primed in the PRIME position and dispenses chemicals in the RUN position.

CHEMICAL FEED PUMP (10). Pumps chemicals into water being processed.

CHEMICAL FEED CONTAINERS (Model 600-3) (11). Hold chemical solutions (polymer, sodium hex, citric acid, and chlorine) which are fed into chemical feed pump.

f. Fig. 1-14 and 1-15 (Army) show the location of the trailer's major components. The Marine Corps ROWPU is skid mounted, but the frame is the same as shown.

FRONT VIEW

REAR VIEW

Figure 1-14. ROWPU Flatbed Trailer And Frame (Army Model No. 600-1)

1-7. EQUIPMENT DATA.

Dimensions and Weights (Trailer without ROWPU - Army Only)

Length	19.01 ft (5.8 m)
Width	8.00 ft (2.44 m)
Height (to top of the wheel cover)	3.18 ft (0.97m)
Weight	5595 lb (2540 kg)
Height to lunette	2.42 ft to 2.92 ft (0.74 m to 0.89 m)
Maximum towing speed	50 mph (80 kmh)
Tire pressure	75 psi (5.27 kg/sqcm)
Voltage	24 V dc

Power Requirements (Overall)

Power	22 kW
Voltage	120V ac, 1-phase; 208-230/460 V ac, 3-phase
Frequency	60 Hertz
Current	104 amp (max)

ROWPU Size - Trailer Mounted (Army)

Length	19.1 ft (5.8 m)
Width	8.0 ft (2.44 m)
Height	8.08 ft (2.45 m)
Weight	16,975 lb (7700 kg)

ROWPU dimensions -Skid Mounted (MC)

Length	9.45 ft (2.86 m)
Width	6.91 ff (2.07 m)
Height	5.68 ft (1.7 m)
Weight	7,300 lb (3311.3 kg)

R.O. Pump Motor

Voltage	200 V ac, 3-phase
Current	56.3 amp
Horsepower	20
Frequency	60 Hertz
Revolutions Per Minute	1175
Duty Cycle	Continuous

R.O. Pump

Type	Positive displacement
Pumping Capacity	51 gpm (193 lpm) 980 psi (689,038 kq/sqm) head
Oil Capacity	2 US gallons (757 liters)
Drive	V-belt

Revolutions Per Minute	500 (maximum)
Backwash Pump Motor	
Voltage	208-230/460 V ac, 3-phase
Current	265-24/12amp
Horsepower	10
Frequency	60 Hertz
Revolutions Per Minute	3450
Duty Cycle	Continuous
Backwash Pump	
Type	Centrifugal
Capacity	120 gpm (454 lpm) 70 psig (49,217 kg/sqm)
Drive	Electric motor
Revolutions Per Minute	3500
Raw Water Pump Motor, 2 each	
Voltage	220-230/460 V ac, 3-phase
Current	5.8/2.9 amp
Horsepower	2
Frequency	60 Hertz
Revolutions Per Minute	3450
Duty Cycle	Continuous
Raw Water Pump, 2 each	
Type	Centrifugal, self-priming
Capacity	30 gpm (114 lpm) 105 ft (32 m) head
Drive	Electric motor
Revolutions Per Minute	3500
Distribution and Booster Pump Motors	
Voltage	208-230/460V ac, 3-phase
Current	3.4-3.2/1.6 amp
Horsepower	1
Frequency	60 Hertz
Revolutions Per Minute	3450
Duty Cycle	Continuous
Distribution and Booster Pumps	
Type	Centrifugal
Capacity	30 gpm (14 lpm) 50 ft (15 m) head
Drive	Electric motor
Revolutions Per Minute	3500

Chemical Feed Pump Motor

Voltage	115/230 V ac, 1-phase
Current	6.2/3.1 amp (Army) 4.8/2.4 amp (MC)
Horsepower	1/3
Frequency	60 Hertz
Revolutions Per Minute.	1725
Duty Cycle.	Continuous

Chemical Feed Pump

Capacity	3.17 gallons/hr (12 liters/hr)
Drive	Electric motor

Multimedia Filter

Flow Rate.	6.5 gpm/sqft
Backwash Flow Rate	70 to 120gpm (265 to 454 lpm)
Pressure Drop	5 psid (nominal) (3516 kg/sqm)

Cartridge Filter

Cartridge (8 cartridge tubes)	
Length	40 in (101.6 cm)
Flow Rate	35 gpm (132.5 lpm)
Pressure Drop	2 to 35 psid (1406 to 24,609 kg / s q m)

1-8. PIPING IDENTIFICATION. The ROWPU piping is identified according to function by the following colors:

Function:	Color:
Raw water	Black band
Backwash waste	Red band
Filtered water	Yellow band
Product water	Blue band
Brine discharge	Purple band
Brine Piping on R.O. pressure vessels	Purple band

Section III. TECHNICAL PRINCIPLES OF OPERATION

1-9. WATER PROCESSING AND CHEMICALS. The ROWPU removes suspended solids (called turbidity), chemicals, and solids held in solution (called dissolved solids), found in most fresh water and seawater sources, to a level fit for human consumption, This is done by filtering with the aid of the reverse osmosis process, and then additional purification using selected chemicals, Refer to figure 1-15 to follow the process described below.

a. First Stage of Filtration–Multimedia Filter. Before raw (untreated) water reaches the multimedia filter, polymer solution is added to it. Polymer collects suspended solids into groups large enough to be removed by the multimedia filter. This process is called coagulation. Water is then filtered through the multimedia filter.

b. Second Stage of Filtration–Cartridge Filter. The cartridge filter takes out finer suspended solids that pass through the multimedia filter.

c. Reverse Osmosis (R.O.) Elements. The first two stages of filtering do not remove dissolved solids from the water. The R.O. elements, through the R.O. process, remove dissolved minerals and any suspended solids that may have passed through the filters.

d. Chlorine Disinfection. As the water leaves the ROWPU, chlorine is added to kill any bacteria present in the product water. At this point, the product water is stored for human consumption.

1–10. REVERSE OSMOSIS (R. O.) PROCESS. Reverse osmosis is the process by which purified water is separated from the available seawater or brackish water source. Pressure is applied to the salt water side of a semi-permeable membrane, and purified water diffuses through the membrane to the freshwater side. The 600 GPH ROWPU is arranged so that pre-filtered water is pumped under pressure across the semi-permeable membranes, called R.O. membranes. The R.O. membranes separate this water stream into a product water stream and a brine concentrate stream, both of which continuously flow away from the membranes.

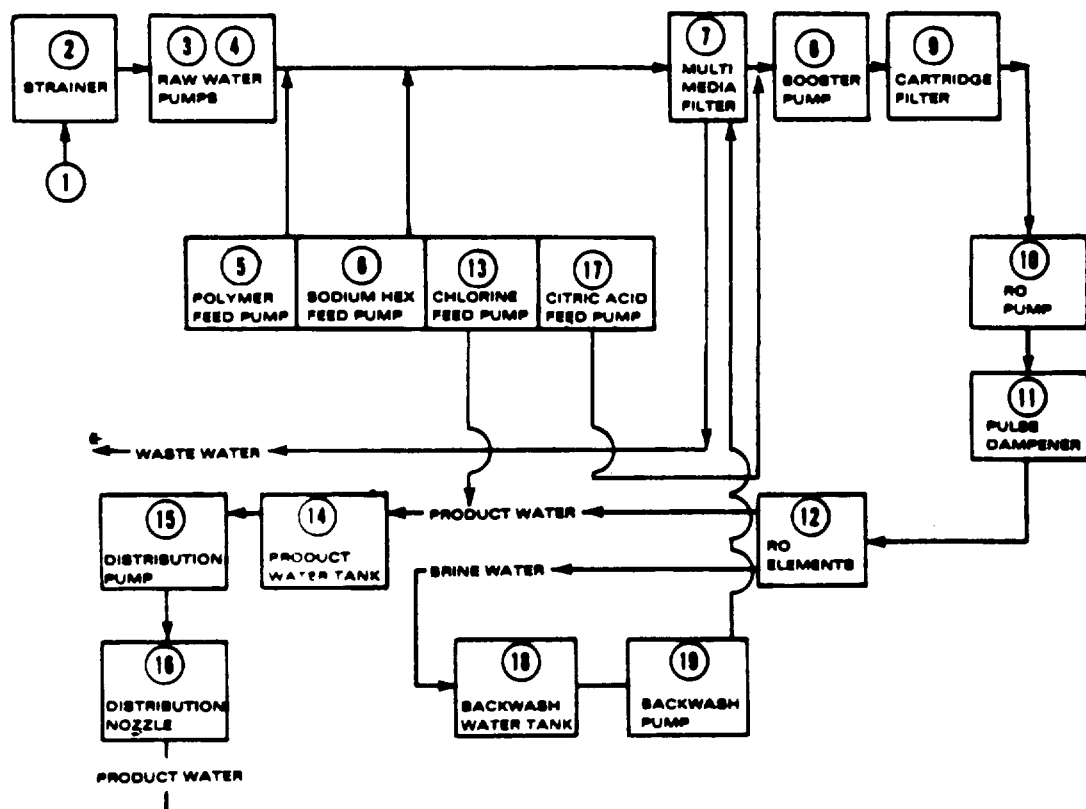

Figure 1-15. Water Processing Block Diagram

WARNING

Source water must be free of chlorine.

RAW WATER SOURCE (1). Any place you can get water.

STRAINER (2). A screen on the end of a suction hose to keep leaves, plants, stones, fish, and dirt out of the pumps and filters of the ROWPU.

RAW WATER PUMPS (3) (4). Draw water from source and pump it into ROWPU under pressure.

POLYMER FEED PUMP (5). Adds polymer (polyelectrolyte) solution to raw water to collect small pieces of floating solid matter into groups large enough to be removed by the multimedia filters.

SODIUM HEX FEED PUMP (6). Feeds diluted sodium hex (sodium hexametaphosphate) to raw water to prevent scaling.

MULTIMEDIA FILTER (7). First stage of filtering for raw water.

BOOSTER PUMP (8). Forces filtered water from multimedia filter through the cartridge filter.

CARTRIDGE FILTER (9). Perform additional filtering of very small particles from water coming out of multimedia filter.

R.O. PUMP (10). Forces filtered water under high pressure through R.O. elements.

PULSE DAMPENER (11). A ball-shaped metal tank used to reduce pulses in water flow caused by pistons of R.O. pump.

R.O. ELEMENTS (12). Rolls of thin films that separate dissolved solids from the raw filtered water.

CHLORINE FEED PUMP (13). Adds chlorine to product water to kill bacteria to make water in tanks drinkable.

PRODUCT WATER TANKS (14). Storage containers for product (drinkable) water.

DISTRIBUTION PUMP (15). Pumps drinkable water from product water tank into the water-carrying vehicle or container.

DISTRIBUTION NOZZLE (16). Used for filling user's container with drinkable water coming from product water tanks by way of the distribution pump.

CITRIC ACID FEED PUMP (17). Adds diluted citric acid (tricarboxylic) to filtered water to maintain the desired pH for the R.O. process to take place.

BACKWASH WATER TANK (18). Stores brine water used for flushing the multimedia filter.

BACKWASH PUMP (19). Pumps brine water backwards from backwash tank through the multimedia filter to flush out accumulated dirt, Recirculates citric acid solution through the R.O. elements to clean them.

OPERATING INSTRUCTIONS

SECTION 1. DESCRIPTION AND USE OF OPERATOR'S CONTROLS AND INDICATORS

2-1. CONTROLS AND INDICATORS (TRAILER). (Army) The only indicators on the flatbed trailer are the stop lights, tail lights, and the blackout light. These lights are powered and controlled from the towing vehicle through a trailer cable. The plug on the cable (fig. 2-1) and the receptacle makes the system operational. The two air hoses connect to the towing vehicle brake system with glad-hand connectors (fig. 2-2). When the trailer is not connected to the towing vehicle, the connectors are stowed on dummy couplers on the trailer to prevent damage and contamination.

Figure 2-1 Electrical Plug

Figure 2-2. Air Hose Glad-Hand Connectors

CAUTION

Do not attempt to move trailer without releasing airbrakes; this requires 90 – 130 psi air pressure applied to air hoses.

2-2. BRAKE SYSTEM. (Army) The service brakes are air-actuated, and the controls are in and part of the towing vehicle. When the two air hoses from the trailer are connected to the connectors on the towing vehicle, the service brake system and the brake pedal on the towing vehicle automatically operate the trailer brakes. An air tank mounted under the trailer frame serves as a reservoir for the operation of the service brake system when the air hoses are disconnected from the towing vehicle. Disconnecting the air hoses causes the service brakes to engage automatically, thus serving as parking brakes for the trailer. Should the air supply from both the towing vehicle and the trailer reservoir be interrupted, a compression spring immediately locks the brakes. See fig. 2-79 for procedure for resetting locked spring brake.

CAUTION

The leveling jacks must be in the stowed position (horizontal position) when towing or shipping the ROWPU by truck or rail.

2-3. LEVELING JACKS. (Army) The leveling jacks are secured by a swivel assembly to a movable support bracket located under the deck of the trailer at each corner. The swivel assembly contains a spring-loaded pin (Model No. 600-1) which can lock the assembly in either the vertical or the horizontal position. In the vertical position, the jacks are used to level the trailer by raising or lowering the trailer corners as necessary. In the horizontal position the jacks are stowed. The front jacks, when locked in the vertical position, can also be used to assist in uncoupling the trailer from the towing vehicle. Turning the crank counterclockwise raises the jackpad; turning the crank clockwise lowers the jackpad.

2-4. SPARE WHEEL AND TIRE CARRIER ASSEMBLY. (Army) The spare wheel and tire carrier has a manually operated, cable-driven winch mounted on the frame structure at the rear end and underside of the trailer. The two wheel lug nuts installed on the carrier are the same as those on the towing vehicle, thereby enabling the use of the towing vehicle's lug wrench for removal or replacement of the spare wheel tire assembly.

2-4.1. WATER METER. This meter is used to indicate the total number of gallons, in tenths of a gallon, of product water the unit has produced. The number of gallons is read directly from the numerals in the small window and the tenths of gallons from the position of the needle on the dial face. (See figure 2-3.)

2-5. CONTROL PANEL. The control panel consists of various gages, valves, lights, switches, and hose connections as shown in fig. 2-4, sheet 1. Their functions are described in Table 2-1 (Keys 1 through 23 and 53).

2-6. CONTROL BOX. The control box consists of the pump control switches and indicator lamps as shown in fig. 2-4, sheet 2. Their functions are described in Table 2-1 (Keys 24 through 43).

2-7. CIRCUIT BREAKER PANEL. The circuit breaker panel is located in the junction box and consists of circuit breakers for the pumps, utility outlets and backwash timer as shown in fig. 2-4, sheet 3. Their functions are described in Table 2-1 (Keys 44 through 52).

Figure 2-3. Controls And Indicators: Control Panel (Sheet 1 of 3)

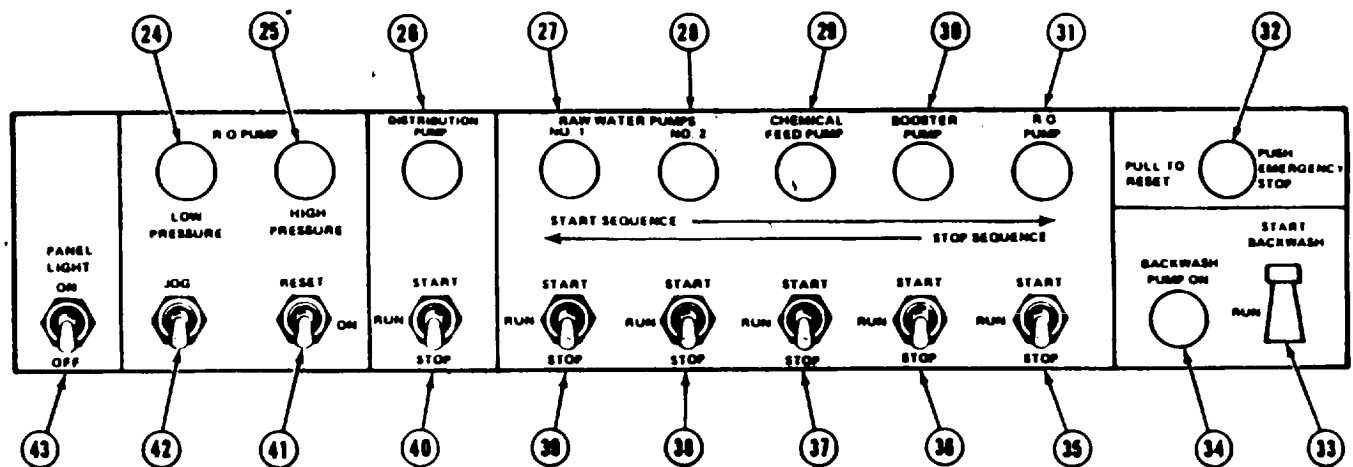

Figure 2-3. Controls And Indicators: Control Panel (Sheet 2 of 3)

Figure 2-3. Controls And Indicators: Control Panel (Sheet 3 of 3)

Table 2-1. Water Processing Controls and Indicators

Key	Control or Indicator	Function
1	Control Box Assembly	Indicator lamps; switches to start, operate and stop (including EMERGENCY STOP) all pumps. (See fig. 2-4 sh 2 keys 24 through 43).
2	Panel Light	Provides light for inside of the ROWPU and for the control panel. It is mounted on a movable bracket that can be pulled forward to provide more light on the control panel.
3	Vent Cartridge Filter Valve	Relieves air from cartridge filter.
4	Vent Pulse Dampener Valve	Relieves air from pulse dampener.
5	Vent Multimedia Filter Valve	Relieves air from multimedia filter.
6	Backwash Valve	Backwash valve has two positions: NORMAL and BACK-WASH. In NORMAL, the valve closes the backwash inlet and allows raw water to flow through the ROWPU. In BACKWASH, the raw water inlet is closed and water is allowed to flow through the backwash inlet. After backwashing, the valve should be returned to the NORMAL position.
7	Multimedia Filter Gage	Indicates differential pressure across the multimedia filter.
8	Waste	Connection for dirty brine used to backwash the multimedia filter.
9	R.O. Vessels Gage	Indicates differential pressure across the R.O. vessels.
10	Raw Water Flow	Measures in gallons per minute the amount of water drawn in by raw water pumps and fed into ROWPU.
11	Backwash Water	Connection for backwash hose.
12	Raw Water	Connection for hose from raw water pumps.
13	Ground Rod	Used to ground ROWPU. Protects personnel from electrical shock.
14	Backwash Water Flow Gage	Measures amount of water flowing through multimedia filter during backwash cycle.
15	R.O. Pressure P.S.I. Gage	Shows discharge pressure of the R.O. pump in pounds per square inch (psi). Gage reading depends on setting of REGULATE PRODUCT FLOW valve.
16	Brine Flow meter	Measures amount of brine flow from the ROWPU in gallons per minute.
17	Regulate Product Flow Valve	Closes the outlet of the R.O. vessels. Controls the rate of flow of the product water. Regulates output pressure of the R.O. pump.

Table 2-1. Water Processing Controls and Indicators (Continued)

Key	Control or Indicator	Function
18	Brine	Connection for brine water hose from the ROWPU to brine tank.
19	Vent Vessels	Diverts water from R.O. vessels to allow multimedia filter to stabilize. Also inputs R.O. element cleaning solution.
20	Product Water Flow	Shows the number of gallons per minute of drinking water put out by the ROWPU.
21	Cartridge Filter Gage	Measures pressure drop across cartridge filter.
22	Product Water	Connection for drinking water from ROWPU to product water tank.
<p style="text-align: center;"><u>CAUTION</u></p> <p>Element Cleaning switch must be OFF when backwashing the multimedia filter. Operating R.O. element cleaning during backwashing can cause damage to the R.O. elements.</p>		
23	R.O. Element Cleaning Switch	Used to operate backwash pump during cleaning of R.O. elements (switch must be OFF at all other times).
<p style="text-align: center;">NOTE</p> <p>See fig. 2-3 sh 2 for illustration of items 24 through 43.</p>		
24	R.O. Pump Low Pressure Indicator Lamp	Blue lamp that comes on when R.O. pump suction pressure drops below 10 psi. This lamp also indicates that R.O. pump should have shut off.
25	R.O. Pump High Pressure Indicator Lamp	Blue lamp that comes on when R.O. pump discharges pressure is higher than 1250 psi. This lamp also indicates that R.O. pump should have shut off.
26	Distribution Pump Indicator Lamp	Green lamp comes on when distribution pump motor is running normally.
27	Raw Water Pump No. 1 Indicator Lamp	Green lamp comes on when raw water pump No. 1 motor is running normally.
28	Raw Water Pump No. 2 Indicator Lamp	Green lamp comes on when raw water pump No. 2 motor is running normally.
29	Chemical Feed Pump Indicator Lamp	Green lamp comes on when chemical feed pump motor is running normally.
30	Booster Pump Indicator Lamp	Green lamp comes on when booster pump motor is running normally.

Table 2–1. Water Processing Controls and Indicators (Continued)

Key	Control or Indicator	Function
31	R.O. Pump Indicator Lamp	Green lamp comes on when R.O. pump motor is running normally. <u>CAUTION</u> The EMERGENCY STOP switch should not be used to shut off the ROWPU except in emergency conditions. To do so can cause damage to the equipment.
32	Push EMERGENCY STOP Switch	When pushed in, this switch shuts off power to all pump motors.
33	Start Backwash Switch	Toggle switch used to start the backwash pump motor.
34	Backwash Pump On Indicator Lamp	Blue lamp comes on when backwash pump motor is running normally.
35	R.O. Pump Start Switch	Toggle switch used to start, run, and stop the R.O. pump motor.
36	Booster Pump Start Switch	Toggle switch used to start, run, and stop the booster pump motor.
37	Chemical Feed Pump Start Switch	Toggle switch used to start, run, and stop the chemical feed pump motor.
38	Raw Water Pump No. 2 Start Switch	Toggle switch used to start, run, and stop the raw water pump No. 2 motor.
39	Raw Water Pump No. 1 Start Switch	Toggle switch used to start, run, and stop the raw water pump No. 1 motor.
40	Distribution Pump Start Switch	Toggle switch used to start, run, and stop the distribution pump motor.
41	R.O. Pump Reset Switch	Toggle switch that resets the high- or low-pressure switch after it shuts off the R.O. pump. If the malfunction has been corrected, this switch will turn off the LOW PRESSURE or HIGH PRESSURE indicator lamp.
42	R.O. Pump Jog Switch	Toggle switch that can be used to run the R.O. pump 3 to 5 seconds.
43	Panel Light Switch	Toggle switch used to turn the panel light on and off.

Table 2-1. Water Processing Controls and Indicators (Continued)

Key	Control or Indicator	Function
		<p>NOTE</p> <p>Items 44 through 52 are circuit breakers located in the junction box, which provides electrical power for all electrical components. See fig. 2-4, sheet 3.</p>
44	R.O. Pump CB 1	Automatically shuts off power to R.O. pump motor if there is an electrical malfunction in the circuit.
45	Backwash Pump CB 2	Automatically shuts off power to the backwash pump motor if there is an electrical malfunction in the circuit.
46	Raw Water Pump No. 1 CB 3	Automatically shuts off power to raw water pump No. 1 motor if there is an electrical malfunction in the circuit.
47	Raw Water Pump No. 2 CB 4	Automatically shuts off power to raw water pump No. 2 motor if there is an electrical malfunction in the circuit.
48	Distribution Pump CB 5	Automatically shuts off power to distribution pump motor if there is an electrical malfunction in the circuit.
49	Booster Pump CB 6	Automatically shuts off power to booster pump motor if there is an electrical malfunction in the circuit.
50	CB 7 Chem Feed Pump	Automatically shuts off power to the chemical feed pump motor if there is an electrical malfunction in the circuit.
51	UTIL Out CB 8	Automatically shuts off power to the utility outlets if there is an electrical malfunction in the circuit.
52	CB 9 Timer Cont	Automatically shuts off power to the backwash timer and backwash pump motor if there is an electrical malfunction in the timer circuit.
53	In-Line TDS Monitor	Used to continually monitor quality of product water.

2-8. VENT VESSELS VALVE. The vent vessel valve is located behind the control panel. Closing vent vessels valve allows approximately 200-300 psi of filtered water pressure to build in R.O. vessels.

Figure 2-4. Vent Vessels Valve

2-9. VENT PRODUCT WATER VALVE. The vent product water valve is located to the right of the top R.O. vessel. It allows air to escape from product water line. It is located on top of product water manifold.

Figure 2-5. Vent Product Water Valve

2-10. CHEMICAL FEED PUMP CONTROLS. Knobs are located as shown and are used to control the flow of each chemical.

Figure 2-6. Chemical Feed Pump Controls

2-11. GATE VALVES. Two gate valves are used. One is installed between the brine tank and backwash pump, the other between the product water tanks; both regulate water flow.

Figure 2-7. Gate Valves

2-12. DRAIN VALVES. Seven drain valves are located at the left front of ROWPU. They are used to draw samples at various stages of purification and to drain water from unit before moving.

Model No. 600-1

Model No. 600-3

Figure 2-8. Drain Valves

2-13. CHEMICAL FEED PUMP VALVES. Valves have two positions: PRIME and RUN. PRIME is for priming chemical feed pumps, and RUN for adding chemicals.

Model No. 600-3

Model No. 600-1

Figure 2-9. Chemical Feed Pump Valves

2-14. TOTAL DISSOLVED SOLIDS (TDS) METER (PORTABLE). The portable TDS meter is used to measure total dissolved solids in raw and product water.

Figure 2-10. Total Dissolved Solids (TDS) Meter (Portable)

2-15. TURBIDITY TUBE. The turbidity tube is used to see how clear the filtered water is.

Figure 2-11. Turbidity Tube

2-16. COLOR COMPARATOR KIT. The color comparator kit is used to measure the amounts of chlorine in the product water and to determine its pH.

Figure 2-12. Color Comparator Kit

2-17. BACKWASH TIMER. The backwash timer automatically starts and ends the different stages of backwash cycle.

Figure 2-13. Backwash Timer

NOTE

(MECHANICAL TIMER)

Model No. 600-1

When backwashing within 4 hours of the previous backwash, rotate the reconditioning knob (fig. 2-70) clockwise to idle position. If knob is not in idle position when backwash switch is activated, backwash cycle will not be in proper sequence.

(SOLID STATE TIMER)

Model No. 600-3

BackWashing can be accomplished at any time without any preset conditions.

SECTION II. PREVENTIVE MAINTENANCE CHECKS AND SERVICES (PMCS)

2-18. GENERAL.

- a. Before You Operate. Always keep in mind each CAUTION and each WARNING. Perform "BEFORE OPERATION" (B) PMCS shown in tables 2-2 and 2-3.
- b. While You Operate. For your own safety and for protection of the equipment pay attention to each CAUTION and WARNING. Perform "DURING OPERATION" (D) PMCS shown in tables 2-2 and 2-3.
- c. After You Operate. Perform "AFTER OPERATION" (A) PMCS shown in tables 2-2 and 2-3.
- d. If The ROWPU Fails To Operate. Troubleshoot with proper equipment. Report difficulties, using the proper forms. Army users see DA PAM 738-750; Marine Corps users refer to TM 4700-15/1.

2-19. PMCS PROCEDURES.

- a. Performing PMCS, tables 2-2 and 2-3, will help keep the ROWPU from breaking down.
- b. It is necessary to know what the numbers and letters on the table mean.

(1) Item number - the order in which ROWPU is checked. It will also be the item number to record results of PMCS in the "TM Number" column on DA Form 2404, Equipment Inspection and Maintenance Worksheet. Marine Corps personnel use form NAVMC 10524.

(2) Interval - when you make your checks:

B	"BEFORE OPERATION"
D	"DURING OPERATION"
A	"AFTER OPERATION"
W	"WEEKLY"
M	"MONTHLY"

(3) Item to be inspected - what should be inspected.

(4) Procedure - how to inspect the item.

(5) For readiness reporting, equipment is not ready/available if - why and when you cannot use your equipment.

CAUTION

Under some operating conditions, slight water leaks from some of the pump bearings may be observed. That is normal. If there is any doubt, or if equipment could be damaged, notify the supervisor or unit maintenance.

Table 2-2. (Army) Operator/Crew Preventive Maintenance Checks and Services (Trailer)

NOTE

Within designated intervals, perform these checks in the order listed. Perform weekly PMCS as well as BEFORE operations PMCS if:

- (1) You are the assigned operator and have not operated the ROWPU since the last weekly PMCS.
- (2) Operating the item for the first time.

B - Before						D -During						A-After						W - Weekly						M - Monthly					
Item No.	Interval					Item to be inspected	Procedures Check for and have repaired or adjusted as necessary					Equipment is not ready/available if:																	
	B	D	A	W	M																								
1	•			•		Towing vehicle electrical system	Check that 24 V power supply is available to trailer.					24 V not available.																	
2	•			•	•	Electrical connector and cable	Check that connector and cable in good condition, insulation unbroken, connector free of dirt and corrosion.					Broken cable or connector.																	
3	•	•		•	•	Lights	Check that tail light, stoplights, and blackout light work properly.					Light system inoperative.																	
4				•	•	Chassis wiring	Inspect for frayed or worn spots in wiring harness.					Wiring excessively frayed, worn or deteriorated.																	
5	•	•		•	•	Service brake system	Start engine of towing vehicle to build up air pressure in brake system. Check for proper operation of brakes					Pressure on brake pedal in towing vehicle does not activate trailer brakes.																	
6	•			•		Air hose couplers	Make sure couplers are securely attached to towing vehicle (or dummy couplers if trailer not attached to a towing vehicle).					Couplers broken.																	
7	•			•	•	Air hoses	Check for cracks, leaks, or other damage.					Hoses broken or leaking.																	
8					•	Air brake tubing reservoir, and other components	Inspect for bends, dents, and leaks which may interfere with proper operation.					Parts badly damaged or leaking.																	
9				•	•	Air reservoir	Drain condensation by opening draincock; close draincock after draining. Check for broken or corroded draincock.					Draincock broken or corroded.																	

**Table 2-2. (Army) Operator/Crew Preventive Maintenance Checks and Services
(Trailer) (Continued)**

B - Before						D-During						A- After						W – Weekly						M - Monthly					
Item No.	Interval					Item to be Inspected	Procedures Check for and have repaired or adjusted as necessary					Equipment is not ready/available if:																	
	B	D	A	W	M																								
10	•			•	•	Tires	Check for proper inflation (75 psi); be sure tires are not excessively worn. Check that all tires are worn evenly.					Tires flat or below recommended pressure.																	
11	•			•		Nuts	Make sure lug nuts on wheels and other equipment fasteners have not worked loose. Check that cap nuts are properly seated and tight.					Lug nuts missing.																	
12					•	Axles, springs	Visually inspect all structural parts for excessive wear, corrosion, broken welds.					Structural parts broken.																	
13				•	•	Trailer frame	Inspect for broken welds.					Welds broken.																	
14				•	•	Lunette	Inspect for loose or damaged bolts.					Lunette misaligned or loose.																	
15	•			•		Leveling jack cranks	Check that cranks are in place on support brackets.																						
16				•	•	ROWPU frame	Inspect for broken welds.					Welds broken.																	

Table 2-3. Operator/Crew Preventive Maintenance Checks and Services (Unit)

B - Before

D -During

A – After

W – Weekly

Item No.	Interval				Item to be Inspected	Procedures Check for and have repaired or adjusted as necessary	For readiness reporting Equipment is not ready/available if:
	B	D	A	W			
1	•	•	•		ROWPU, General	<p>Inspect the general appearance of the unit, paying particular attention to the words on identification markings and the condition of the paint. Inspect for rust, especially on weldments.</p> <p>Inspect for water leaks; loose or missing bolts, screws, nuts, and hoses. Inspect for damage since the equipment was last used. Inspect for loose or broken cable connections.</p>	
2	•		•		Tools and Equipment	<p>Inspect tools and toolbox</p> <ul style="list-style-type: none"> • Good shape • Clean • All there • In proper place • Box mounts solid • Box closes properly 	
3	•		•		Vent and drain lines	<p>Check vent and drain line connections</p> <ul style="list-style-type: none"> • Solid • Any damage • No obstructions 	Lines are broken or clogged
4	•		•		Frame and equipment	<p>Remove oil, grease, mud chemical spills, and other matter from all parts of the ROWPU. Use clean cloths. Wash the floor with product water.</p>	
5	•	•	•	•	Multimedia filter	<p>Inspect for leaky gaskets, and loose mountings. Notify unit maintenance if you find trouble. Check multimedia gage readings. Should read within 5 psid of initial log reading, and in no case exceed 10 psid.</p>	Raw water will not flow through filter. Filter cannot be back-washed. Gage reading exceeds either 5 psid of initial log reading or 10 psid.

**Table 2-3. Operator/Crew Preventive Maintenance Checks and Services
(Unit) (Continued)**

B – Before

D –During

A - After

W - Weekly

Item No.	Interval				Item to be inspected	Procedures Check for and have repaired or adjusted as necessary	For readiness reporting Equipment is not ready/available if:
	B	D	A	W			
6		•			Cartridge filter	Check for leaks. Check cartridge filter gage readings. Should be 1–20 psid.	Raw water will not flow through filter. Gage reads over 20 psid.
7	•	•	•		Gages and flow indicators	Inspect for broken glass. Look for loose mountings and tube connections.	Gages or flow indicators are in-operative.
8	•		•		Frames: ROWPU BACKWASH PUMP, DISTRIBUTION PUMP, RAW WATER PUMPS	Inspect for damaged or bent frames, loose mounting bolts, and missing or broken tiedowns and frame pins. Inspect crossmembers and beams for cracks and breaks. Tighten loose mounting bolts. Report breaks, misfits, cracks, damaged framework, or missing hardware to unit maintenance.	Outlying pumps cannot be set due to frame damage.
9				•	Canvas items: frame cover, pump covers, holddown straps	Inspect for rips, tears, or other damage. Report damaged items to unit maintenance.	
10	•	•	•		Hoses, tanks, piping, tubing, fittings, strainers, and nozzle	Inspect for leaks. Look for hose or pipe blockages. Are parts cracked or broken? Tighten loose connections. <u>CAUTION</u> Don't overtighten. It will ruin threads. Stripped threads will cause connections to leak. Replace damaged raw water strainer, chemical feed pumps strainer, backwash pump filters, and distribution nozzle. Report a leaky tank to unit maintenance. Replace damaged hoses.	There is not enough undamaged hose to set up the ROWPU. Neither product water tank will hold water.

**Table 2-3. Operator/Crew Preventive Maintenance Checks and Services
(Unit) (Continued)**

Item No.	Interval				Item to be inspected	Procedures Check for and have repaired or adjusted as necessary	For readiness reporting Equipment is not ready/available if:
	B	D	A	W			
11	•	•	•		Chemical feed equipment: plastic pails, tubes, and strainers and chemical cans	Inspect container/rack, pails/cans and tubes for cuts, cracks or holes. Inspect during operation for leaks Inspect strainer for clogging. After operation, drain and clean pails, tubes and strainers and chemical cans.	Pails/cans are so damaged that they will not hold chemicals Tubes will not draw chemicals into the pumps.
12	•	•	•		Chemical feed pump	Inspect for loose mounting nuts. Inspect for cracked or broken fitting. Check oil level before operation. Add oil as necessary. Refer to LO 5461 0-215-12/LI 08580A-12. Listen for unusual noises during operation. Notify unit maintenance to replace malfunctioning pump. For sight glass location and oil filling instructions, see lubrication order LO 10-4610-215-12/LI 08580A-12	Any one of the four pumps will not supply chemical to the purification cycle.
13	•	•	•		Chemical feed pump motor	Check for loose mounting nuts and bolts. Look for loose wires at conduit box. Listen for unusual noises during operation. Notify unit maintenance to replace malfunctioning motor.	Motor will not operate.
14	•	•	•		Chemical feed pump priming valves	Inspect for broken or missing pipe nipples. Check for free operation of valve handles. Check for chemical corrosion.	Valves will not prime chemical feed pump.

Item No.	Interval				Item to be inspected	Procedures Check for and have repaired or adjusted as necessary	For readiness reporting Equipment Is not ready/available if:
	B	D	A	W			
						<p><u>WARNING</u></p> <p>Do not operate ROWPU with an open control box assembly; it can kill you.</p> <p>Inspect the plug connectors, toggle switches, and lamps for loose mountings and bad parts. Replace lamps that don't work. See that the junction box is securely mounted and kept closed.</p>	
20	•				R.O. pump drive belt guard	Inspect belt guard for loose mounting bolts. Tighten all studs, nuts, and capscrews.	Belt guard off or hanging.
21	•				R.O. Pump drive belts	Check all five V-belts for cracks, rubbing, and signs of wear. Check belt tension: You should be able to push belts down only a half-inch at center of span.	Belt tension requires adjustment; belts are defective.
22	•				R.O. pump, wiring, motor mounts, head gasket and piping	<p>Inspect wire connection going to junction box. Inspect the motor mounts for cracks or breaks. Look for dirt, corrosion, or water damage. Check for head gasket leaks and piping leaks.</p> <p><u>WARNING</u></p> <p>P-D-680 is potentially dangerous. Avoid repeated and prolonged breathing of vapors and skin contact with the liquid. Do not use near open flame, arcing equipment or other ignition sources. Always wear protective clothing and eyewear.</p>

A - After

W - Weekly

Item No.	Interval				Item to be inspected	Procedures Check for and have repaired or adjusted as necessary	For readiness reporting Equipment is not ready/available if:
	B	D	A	W			
26				•	Low- and high-pressure switches and toggle switches	<p>Water leaking into the cavity past the seals (packing) is normal. The pump is designed such that accumulated water will be drained from the cavity through the plastic drain tube to the ground. However, as the packing and plungers wear from normal operation, the water leakage will become more severe. When the drain tube can no longer accommodate the flow, the cavity will fill with water, which could enter the crankcase and contaminate the oil.</p> <p>If the water level rises near the plungers, the packing and the plungers, if scored, must be replaced. Report this condition to unit maintenance.</p> <p>Inspect for dust or dirt. Inspect for loose or damaged wires. Report loose or damaged wires to unit maintenance.</p>	Toggle switches are broken. Switch cases are broken. Bare wires are visible.
27	•	•	•		Pump assemblies	<p>Inspect the pumps for loose mountings, damaged frames, cracked housings, and leaky seals. Inspect pumps for unobstructed, clockwise rotation. Listen for unusual noises from pumps or pump motors during operation.</p>	Raw water pumps or booster pump do not work.
28	•		•		Cable assemblies	<p>Inspect electrical cable assemblies for cracked, broken or cut insulation Inspect connectors on ends of cables. Report any unserviceable cable assembly to unit maintenance.</p>	Cables are broken or bare wires are visible.

**Table 2-3. Operator/Crew Preventive Maintenance Checks and Services
(Unit) (Continued)**

Item No.	Interval				Item to be inspected	Procedures Check for and have repaired or adjusted as necessary	For readiness reporting Equipment is not ready/available if:
	B	D	A	W			
29	•	•			Backwash timer	Inspect outside for cleanliness Inspect for loose wiring. Wipe dirt from timer. Report a nonoperating timer to unit maintenance.	Backwash timer does not work.
30	•			•	Ground rod	Inspect for damaged ground wire connections, and loose, damaged, or missing screw joints and driving bolt. Clean and tighten ground connections and screw joints. Report unserviceable ground rods to unit maintenance.	There is only one usable section of ground rod.
31				•	Data and instruction holders and plates	Inspect for damage and for missing parts.	
32		•			R.O. vessel assemblies	Inspect for damage (cracks, breaks, leaks), and loose or missing mounting hardware. Tighten loose hardware. Report damaged assemblies to unit maintenance.	Any R.O. vessel is cracked or broken; R.O. vessels leak around seals.
33	•	•	•	•	30 kW generator set (Army)	Inspect and service generator set as shown in applicable manual for generator (TM 5-6115-465-12 for NSN 6115-00-118-1240).	
34	•		•		(Army) Portable step	Inspect for rust and cracked or broken weldments.	
35	•		•		Storage boxes	Inspect for broken panels. Check for broken or missing hardware. Report damage to unit maintenance.	
36	•	•	•		Special tools: paddle, valve seat puller, R.O. element puller, pilot bulb puller	Inspect for bent shafts and stripped threads. Replace damaged tools.

	B	D	A	W			
37	•		•		Circuit breakers	Inspect for cracked or broken parts. Before connecting generator set, check for free movement of handle. Inspect for signs of burning or arcing.	Any circuit breaker is damaged or will not move easily
38	•	•	•		Water testing equipment: lab beaker, graduated cylinder, solution indicator, thermometer	Check for cracked or broken glass. Check to see that all markings are readable. Replace damaged items.	
						CAUTION When checking rupture disc, do not overtighten the hold down screw. Finger tighten and then tighten 1/8 turn with wrench.	
39	•				Rupture disc assembly	Before operation make sure an intact rupture place. Check for leaks around rupture disc assembly.	A rupture disc is not in place. There is leakage around rupture disc seat.
		•	•				
40	•	•			Pulse dampener	Inspect for broken, rusted, or missing mounting hardware. Check for cracks on weldment. Inspect for leaks.	There is any damage to weldment.
41	•	•			High-pressure relief valve	Inspect for rust. Check for leakage at base of relief valve.	There is leakage at relief valve union to pipe.

SECTION III. OPERATION UNDER USUAL CONDITIONS

2-20. CHOOSING THE SITE. When choosing the site to set up and run the ROWPU, remember the following:

- a. If a stream is to be used as the raw water source, pick a site for the ROWPU upstream from camp.

WARNING

Ensure that the site provides downstream waste water drainage away from the water source.

CAUTION

Consider variable weather conditions when choosing site; avoid areas vulnerable to flash flooding.

NOTE

Illustration denotes Army ROWPU. MC unit is skid mounted.

Figure 2-14. Site Diagram

- b. The raw water hoses can reach about 75 feet. Ensure the ROWPU is placed close enough for the hoses to reach the stream or lake, and check that the ground is solid and fairly level.
- c. Take advantage of available forest cover.
- d. Take advantage of finished roads. They can furnish a solid, level surface

2-21. PREPARATION FOR USE. Upon reaching the operating area, prepare the ROWPU for operation. For Army units, refer to figures 2-17 (Model No. 600-1, sheets 1-3) and 2-18 for trailer set-up, then follow para. 2-22a through 2-22 ad. For skid-mounted units (Model No. 600-1 and 600-3), skip to para. 2-22 a through 2-22 ad.

1. CHOOSE A SITE AS NEARLY LEVEL AS POSSIBLE; CLEAR SITE OF ROCKS AND VEGETATION. BE SURE SURFACE IS FIRM ENOUGH TO SUPPORT THE TRAILER-MOUNTED ROWPU.
2. MANEUVER TRAILER INTO POSITION WITH TOWING VEHICLE. BE SURE ALL SIDES OF TRAILER, AND FITTINGS AND CONTROLS FOR THE ROWPU ARE EASILY ACCESSIBLE. IF TOWING VEHICLE IS TO BE DISCONNECTED FROM TRAILER, USE FRONT LEVELING JACKS TO HELP IN UNCOUPLING.

3. RELEASE PINTLE (1), AND DISCONNECT TRAILER SAFETY CHAIN (2) FROM TOWING VEHICLE. PLACE TRAILER SAFETY CHAIN (2) IN STOWED POSITION ON TRAILER DRAWBAR (3).

4. TO ROTATE FRONT LEVELING JACKS TO VERTICAL POSITION, PULL OUT SPRING-LOADED LOCKING PIN (4) ON JACK SWIVEL ASSEMBLY (5); ROTATE JACK (6) TO VERTICAL POSITION. ALLOW LOCKING PIN (4) TO SPRING BACK TO LOCKED POSITION.

5. REMOVE SAFETY PIN (7) AND CRANK HANDLE (8) FROM REAR OF JACK SUPPORT BRACKET (9).

Figure 2-15. Preparation For Use (Sheet 1 of 3)
(Army Model No. 600-1)

6. POSITION CRANK HANDLE (8) ON JACK (6) AND TURN HANDLE CLOCKWISE TO LOWER JACK PAD (10). CONTINUE TO LOWER BOTH FRONT JACKS UNTIL WEIGHT OF TRAILER RESTS ON JACKS INSTEAD OF TOWING VEHICLE, AND LUNETTE IS CLEAR OF PINTLE.

7. REPLACE CRANK HANDLE (8) ON REAR OF JACK SUPPORT BRACKET (9); INSTALL SAFETY PIN (7).

8. DISCONNECT ELECTRICAL CABLE (11) FROM TOWING VEHICLE. STOW CONNECTOR (12) IN STOWAGE CUP (13) ON TRAILER DRAWBAR (3).

9. DISCONNECT AIR HOSES (14) FROM TOWING VEHICLE. PARKING BRAKES ARE NOW SET. STOW AIR HOSES (14) ON DUMMY COUPLINGS (15) PROVIDED ON TRAILER DRAWBAR (3).

Figure 2-15. Preparation For Use (Sheet 2 of 3)
(Army Model No. 600-1)

11. TO ROTATE REAR LEVELING JACKS TO VERTICAL POSITION, PULL OUT SPRING-LOADED LOCKING PIN (16) ON JACK SWIVEL ASSEMBLY (17); ROTATE JACK (18) TO VERTICAL POSITION. ALLOW LOCKING PIN (16) TO SPRING BACK TO LOCKED POSITION.

12. REMOVE SAFETY PIN (19) AND CRANK HANDLE (20) FROM REAR OF JACK SUPPORT BRACKET (21).

13. POSITION CRANK HANDLE (20) ON JACK (18) AND TURN HANDLE CLOCKWISE TO LOWER JACK PAD (22). CONTINUE TO LOWER BOTH REAR JACKS UNTIL JACK PADS REST FIRMLY ON THE GROUND.

14. REPLACE CRANK HANDLE (20) ON REAR OF JACK SUPPORT BRACKET (21); INSTALL SAFETY PIN (19).

Figure 2-15. Preparation For Use (Sheet 3 of 3)
(Army Model No. 600-1)

2-22. PREPARATION FOR OPERATION.

Figure 2-16. Unfold Safety Step (Army)

- a. Roll up the canvas cover over the ROWPU frame and fasten with tie-back straps.

NOTE

Illustration denotes Army ROWPU. MC units are skid mounted.

Figure 2-17. Canvas Cover Tied Back

b. Looking at the ROWPU from above, with canvas removed, you can see various items stored.

Illustration denotes Army Model 600-1. MC units are skid mounted with a separately packed distribution pump and without a step ladder. Model 600-3 also has chemical feed containers/rack (11, fig. 1-13).

Figure 2-18. Top View of ROWPU

c. Remove the two frame cross braces. Store them on top of ROWPU canvas. Release cargo straps by loosening the sawtooth (ratchet) holders. Unsnap hooks on bottom of straps. Roll up cargo straps and put them on top of ROWPU canvas.

NOTE

Illustration denotes Army ROWPU. MC units are skid-mounted.

Figure 2-19. Cross Braces, Cargo Straps, Ratchets

- d. Remove one suction hose float and five chemical pails.

FLOAT

UTILITY PAILS

- e. Remove three hard rubber suction hoses that are used for raw water input. Be careful not to damage threaded ends.

- f. Remove from ROWPU overpack:

One brine tank, (6).

Two product water tanks, (7) and (8).

Tank supports, guy ropes.

Tank ground cloths and covers.

Paddle, (12) .

Sledge hammer, (11).

Chemical feed containers, (16) (All models except 600-1)

One 2-inch and nine 1 1/2-inch suction (hard rubber) hoses (13); nine discharge (canvas) hoses; three 2-inch and six 1 1/2-inch hoses.

Storage boxes (9) and (10) (remove but do not unpack).

Figure 2-20. Top View of ROWPU and Overpack

NOTE

Only two storage boxes exist. They are labeled "Storage Box No. 2" and "Storage Box No. 3".

Figure 2-21. Storage Box No. 2

Figure 2-22. Storage Box No. 3

- g. Inspect storage boxes to ensure they contain all items as listed in Appendix B.
- h. Release holddown straps over the two raw water pumps(1). Remove canvas covers. Lift both raw water pumps off the ROWPU.

WARNING

To avoid injury, get help to lift backwash pump.

Figure 2-23. Outboard Pumps

- i. Release straps over the backwash pump (3) and remove cover. Remove pump from ROWPU.
- j. (Army) The distribution pump (2) is fastened to the rear platform of the ROWPU trailer. It is packaged for two men to carry (portable). Release holddown straps, remove the ladder and canvas cover, then remove the distribution pump from trailer.
- k. (MC) The distribution pump (2) is packaged for two men to carry (portable), and is separate from unit. Remove packing material and canvas cover from pump.

NOTE

The portable total dissolved solids (TDS) meter is factory calibrated to give conductivity characteristics closely representing natural fresh waters. When treating seawater and brackish water, it will be necessary to recalibrate the meter on a standard sodium chloride solution in order to get accurate readings on the product water and raw water.

- l. Open the chemical storage box (box No. 2). Take out the calibrated measuring container (sample beaker) and the portable total dissolved solids (TDS) meter.

Figure 2-24. Total Dissolved Solids (TDS) Meter

m. Position operational equipment as shown in fig. 2-28 before starting initial installation.

CAUTION

Avoid kinking or excessive looping of hoses.

NOTE

Illustration denotes Army model. MC units are skid mounted.

Figure 2-26. Typical Water Tank Installation

o. Attach float to strainer with enough rope to allow strainer to go under water but not touch bottom. Avoid placing the strainer near sandy areas. Hook up raw water system (fig. 2-30). Use only enough hose to reach from the water source to the ROWPU.

CAUTION

Ensure all hose connections are tight and seals are in place. Raw water pumps will not prime if the raw water hoses draw air. To prevent damage to ROWPU due to leaves and dirt, DO NOT operate pumps without strainer.

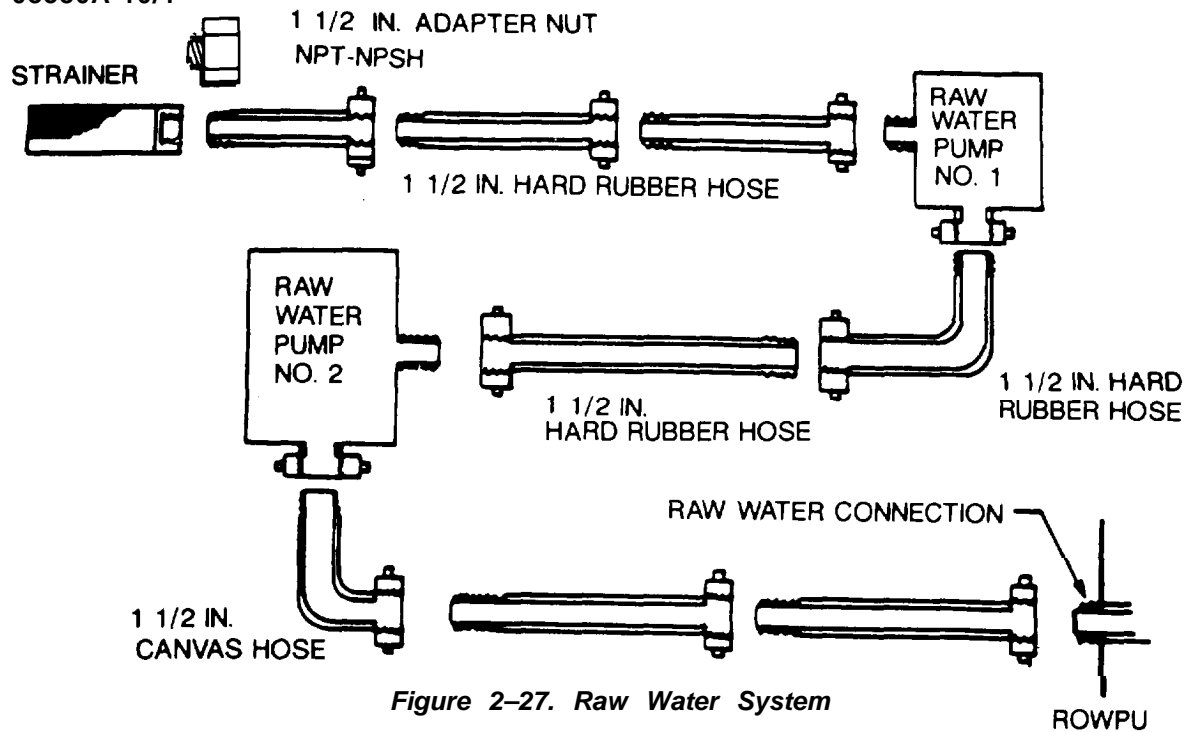

Figure 2-27. Raw Water System

- p. Install the backwash strainer onto the backwash pump frame (fig. 2-31).
 - (1) Remove straps securing strainer to backwash pump.
 - (2) Remove the two mounting bolts, nuts, and washers from the backwash strainer bracket.
 - (3) Remove caps from strainer and pump outlets.
 - (4) Attach strainer inlet connection to swivel connector on backwash pump.
 - (5) Place backwash strainer bracket against the frame and line up the holes.
 - (6) Insert two bolts into mounting holes, placing washers and nuts as required.
 - (7) Tighten all connections.

Figure 2-28. Backwash Pump And Strainer

q. (See fig. 2-32) Connect the backwash water tank hose to suction side of backwash pump. Connect backwash water line to discharge side of backwash pump. Start at the ROWPU and work toward the tank in making connections.

Figure 2-29. Backwash Water System

r. Attach product water systems hose (fig. 2-33), working backwards from the distribution nozzle until last connection is made at the ROWPU. Make sure pump drain valve is closed.

Figure 2-30. Product Water System

s. Hook up waste water and vent vessels systems (fig. 2-34). Start at ROWPU with hose going down and away from the ROWPU, ending well downstream of raw water intake.

CAUTION

Recheck all hose connections to make sure they are tight.

Figure 2-31. Waste Water System

t. Wood Paddles and Chemical Tubes. Open Storage box No. 3 (fig. 2-35) and remove the wood paddles and four sets of chemical tubes.

- (1) Examine tubes. They must be open and clean.
- (2) Check strainers. They cannot be clogged. Must be tightly fastened to tubes.

Figure 2-32. Wood Paddles and Chemical Tubes

u. Attach tubes to the valves and pump as follows:

- (1) Model 600-1.

CAUTION

When installing hoses on chemical feed pump, be careful not to exert any side force on the barb hose fittings; they are easily broken.

- (a) Two tubes to POLYMER.
- (b) Two tubes to SODIUM HEX.
- (c) Two tubes to CHLORINE.
- (d) Two tubes to CITRIC ACID.

(2) Model 600-3.

- (a) Blue tubes to POLYMER can.
- (b) Green tubes to SODIUM HEX can.
- (c) Red tubes to CHLORINE can.
- (d) Yellow tubes to CITRIC ACID can.

Figure 2-33. Tubes Attached to Chemical Feed Pump

WARNING

Chemicals used for operating ROWPU can kill you. The chemicals alone or in mixture can be dangerous. ALWAYS wear protective clothing and make sure area is well ventilated.

CAUTION

Use only chlorine-free water for mixing to prevent damage to ROWPU membranes. If this is the first time the ROWPU is being started, use raw water to mix chemicals. If you are restarting the unit, use brine from storage tank.

v. Mix polymer chemical:

(1) Fill 107 ml measure HALF-FULL with liquid polymer chemical (there is no half-full mark on measure).

(2) Pour liquid chemical into POLYMER pail.

(3) Add brine (if available) or raw water up to the 3-gallon mark.

(4) Stir with wooden paddle for one minute (or longer), until all chemical is dissolved.

(5) (Model 600-1) Leave POLYMER in the pail and place both tubes (from POLYMER valve and pump) into the pail.

(6) (Model 600-3) Pour solution into 5-gallon container marked POLYMER.

w. Mix Chlorine Solution:

(1) Pour 3 gallons of brine into unmarked pail.

(2) Fill CALCIUM HYPOCHLORITE measure with 0.2 pounds (91 grams) of calcium hypochlorite.

WARNING

Mark one pail for chlorine use only. DO NOT use for other chemicals.

(3) Pour calcium hypochlorite into pail marked CHLORINE.

(4) Pour brine (if available) or raw water from unmarked pail into CHLORINE pail.

(5) Stir with wooden paddle for 1 minute (or longer), until all chemical is dissolved.

NOTE

Mixing calcium hypochlorite with water produces a chlorine solution. It is normal to see white particles in the solution.

(6) (Model 600-1) Leave CHLORINE in the pail and place both tubes (from CHLORINE valve and pump) into the pail.

(7) (Model 600-3) Pour solution into 5-gallon container marked CHLORINE.

WARNING

(Model 600-1) Make sure the CHLORINE tubes are in the CHLORINE container and the tubes are connected to the CHLORINE pump and valve.

(Model 600-3) Make sure all hose connections are secure on pump, valves and containers.

x. Mix sodium hexametaphosphate (sodium hex):

(1) Pour 0.1 pounds (45 grams) of sodium hex into SODIUM HEX measure.

(2) Put sodium hex into pail marked SODIUM HEX.

(3) Add brine (if available) or raw water to pail marked SODIUM HEX to the 3-gallon mark.

(4) Stir with wooden paddle for 1 minute (or longer), until all chemical is dissolved. ■

(5) (Model 600-1) Leave SODIUM HEX in the pail and place both tubes (from SODIUM HEX valve and pump) into the pail.

(6) (Model 600-3) Pour solution into 5 gallon container marked SODIUM HEX.

y. Mix citric acid:

NOTE

Perform this step only if ROWPU will be operated 20 or more hours before changing sites. Otherwise, proceed to step aa.

(1) Pour three quarter pounds (340 grams) of citric acid into pail marked CITRIC ACID.

(2) Add brine (if available) or raw water to pail marked CITRIC ACID to the 3-gallon mark.

(3) Stir with wooden paddle for 1 minute (or longer), until all chemical is dissolved. ■

(4) (Model 600-1) Leave CITRIC ACID in the pail and place both tubes (from CITRIC ACID valve and pump) into the pail.

(5) (Model 600-3) Pour solution into 5-gallon container marked CITRIC ACID.

z. (Model 600-3) Check chemical solution levels by pulling level indicators up, and then gently letting go. Indicators should remain raised and read approximately 1/4 full.

aa. Ground the ROWPU with ground rod kept on outside bottom of the control panel (fig. 2-37). First remove the rod with the bolt screwed into the coupler. The bolt keeps from damaging the coupler when the rod is driven into the ground. Drive the first 3-foot section into the ground with the 6-pound hammer, or use the slide hammer.

WARNINGS

ELECTRICAL HIGH VOLTAGE CAN KILL YOU

- Electrical high voltage cannot be seen but it can kill you. Electricity is unlike most other dangerous things you can come in contact with because it gives no warning and no symptoms to be wary of. Its effect is immediate. It can kill you, render you unconscious, or severely burn you. To ensure your safety and that of other maintenance personnel, always observe the following precautions:

ALWAYS make sure the unit is properly grounded.

- Take extreme care to prevent injury to fingers or hands when driving the ground rods. Do not place hands between the ram and drive collar. Gloves should be worn. Be sure all connections are tight so as to avoid a possible spark between the units and ground rod.

ab. When the first rod coupler is approximately 6 inches above ground, remove the driving bolt. Screw a new length of ground rod into the one already in the ground and drive it in as with the first section. Continue this process until there are 8 feet of rod in the ground.

When done driving the ground rod, connect the rod sticking out of the earth to the GROUND lug located on the ROWPU frame immediately below the ROWPU electrical cable connections. Use the ground strap provided.

Figure 2-34. Ground Rod In Stowed Position

NOTE

If driving gets too hard, soak the earth and try driving rod until 8 feet of rod is in the ground. If this does not work initially, continue alternately soaking ground and driving rod. If unable to get 8 feet of rod into the soil, then keep soil moist around the rod for the duration of the operation.

ac. Unwind the power cables of each pump. Pull the cables to the ROWPU junction box and unscrew the covers of the connectors. Attach pump cables to the connectors shown in fig. 2-38. Plug the power cable from the power source into J1, if not already installed.

Figure 2-35. Junction Box

2-23. INITIAL ADJUSTMENTS AND CHECKS.

a. Drain Valves. Close all drain valves. Drain valves must remain closed at all times during operation.

NOTE

You will find all seven drain valves to the left front of the ROWPU as shown.

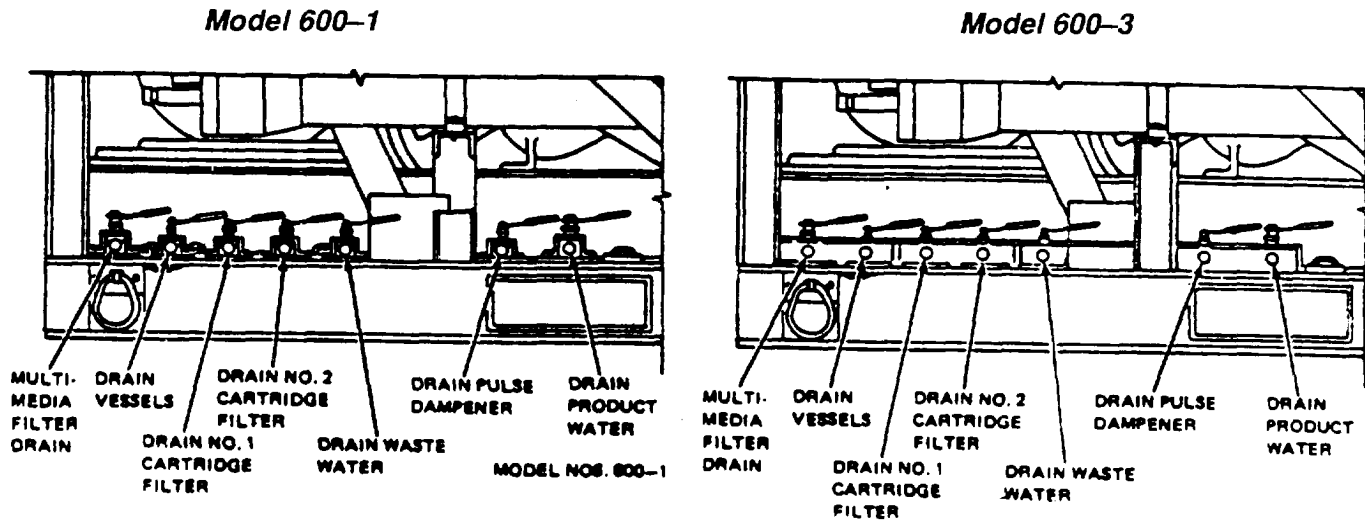

Figure 2-36. Drain Valves (During Operation)

b. Vent Valves. Open all five vent valves as listed below. Three are on the control panel, one is behind the panel and one is to the right of the top R.O. vessel.

1. VENT CARTRIDGE FILTER
2. VENT PULSE DAMPENER
3. VENT MULTIMEDIA FILTER
4. VENT VESSELS (BEHIND PANEL)
5. VENT PRODUCT WATER (see fig. 2-41)

NOTE

The fifth vent valve, the VENT PRODUCT WATER valve, is located on top of product water manifold.

Figure 2-37. Vent Valves

Figure 2-38. Vent Product Water Valve

- c. Backwash Valve. Set the backwash valve to normal. Position as shown (Fig. 2-42).

NOTE

Prior to initial water production and after movement to a new worksite, backwash the multimedia filter (para. 2-26).

Figure 2-39. Backwash Valve

- d. Regulate Product Flow Valve. Turn the REGULATE PRODUCT FLOW VALVE handle fully counterclockwise to the open position (Fig. 2-43).

Figure 2-40. Product Flow Valve

e. Control Box Switches.

(1) Check switches in the control box assemblies. If you find any switch in the START or RUN position, set it to STOP or OFF.

Figure 2-41. Control Box Switches

NOTE

The switches marked START are spring loaded. Upon release they return to the middle (RUN) position. The ones marked JOG, RESET, and START BACKWASH return to the normal position when released.

(2) An indicator lamp is associated with each switch except for the EMERGENCY STOP button. Check the setting of the EMERGENCY STOP button. Pull button until it remains out when released. This is the normal operating position.

f. Element cleaning switch. Check that the ELEMENT CLEANING switch is in the OFF position. It should be off at all times except while cleaning R.O. elements (para. 2-29).

Figure 2-42. Element Cleaning Switch

9. Chemical Feed Pump Valves. Ensure all valves are in PRIME position (fig. 2-10).
- h. Backwash Timer. (Model No. 600-1). Ensure white cam is in SR position (para. 2-26b(1)). (Model No. 600-3) Press RESET button on subpanel to ensure pilot controller valve is in SERVICE position (para. 2-26b (2)).
- i. Take an unmarked pail and an adjustable wrench to the source of water. Check suction hoses in raw water to make sure strainer is under water. With the pail, draw some raw water from the source. Take it to raw water pump No. 1.

Figure 2-43. Raw Water Pump (Prime and Drain)

- j. Check drain valves (petcocks) on the pump. If open, close them. Remove priming plug with your wrench. Fill pump with raw water. Screw priming plug back into pump. Return adjustable wrench to tool case.

2-24. SAFETY VALVES. The ROWPU has three automatic safety devices: the high-pressure relief valve, the high-pressure switch, and the rupture disc assembly.

a. The HIGH PRESSURE RELIEF VALVE is located just behind the PULSE DAMPENER VALVE. If R.O. pressure goes above 1100 psi, this valve opens automatically and discharges water through a pipe at the back of the ROWPU. If this valve activates (indicated by sudden pressure loss), immediately press the PUSH EMERGENCY STOP switch. Open REGULATE PRODUCT FLOW VALVE after unit is shut down. When the pressure drops below 1100 psi, the valve will close automatically.

Figure 2-44. High Pressure Relief Valve And Rupture Disc

CAUTION

If the valve does not close automatically, notify unit maintenance and do not try to restart the ROWPU.

After the HIGH PRESSURE RELIEF VALVE closes, clean the R.O. elements (see para. 2-28) and start the ROWPU in the normal manner (para. 2-25).

b. The HIGH PRESSURE SWITCH is mounted to the rear of the front panel adjacent to the PANEL LIGHT. The HIGH PRESSURE SWITCH activates above 1250 psi. If the HIGH PRESSURE SWITCH activates, the R.O. pump will automatically shut down and the HIGH PRESSURE LAMP (blue) will come on. When the pressure drops, use the RESET SWITCH to reset high pressure switch. Notify unit maintenance to troubleshoot the HIGH PRESSURE RELIEF VALVE.

c. The RUPTURE DISC ASSEMBLY is located on the pipe between the R.O. PUMP and the PULSE DAMPENER. The rupture disc is a thin sheet of metal that tears when the pressure goes above 1425 psi. Water is then discharged through the six holes in the top of the assembly. Because the water is under such high pressure, it will make a lot of noise, and water will be sprayed on the inside of the ROWPU. If the RUPTURE DISC ASSEMBLY ever activates, press the PUSH EMERGENCY STOP switch and open the REGULATE PRODUCT FLOW valve. When the pressure has dropped, replace the RUPTURE DISC (see para. 3-7) and clean the R.O.

elements (see para. 2-28). Also notify unit maintenance to troubleshoot the HIGH PRESSURE RELIEF VALVE and the HIGH PRESSURE SWITCH:

2-25. OPERATING PROCEDURES.

- a. Apply power to the ROWPU.

NOTE

The blue lamp, R.O. PUMP LOW PRESSURE, on ROWPU control box assembly comes on as soon as power is applied to the ROWPU.

- b. Push EMERGENCY STOP button in if any of the following conditions exist:

Operating personnel could be injured or the equipment could be damaged if operation of the ROWPU is allowed to continue.

(1) Blue HIGH PRESSURE lamp associated with R.O. PUMP comes on but R.O. Pump does not automatically stop.

(2) Blue LOW PRESSURE lamp associated with R.O. PUMP comes on but R.O. Pump does not automatically stop.

(3) Some other serious trouble (malfunction) indicated by noise, vibration, large water leaks, etc.

Figure 2-45. Emergency Stop Button

Figure 2-46. High/Low Pressure Lamps

NOTE

If low or high-pressure switches shutdown the ROWPU automatically, they can only be reset with the RESET switch. After emergency shutdown, distribution of drinking water can still be made by pulling out the EMERGENCY STOP button and running the distribution pump as required.

- c. Go to control box assembly on the ROWPU. Locate the two lamps and switches for RAW WATER PUMPS.

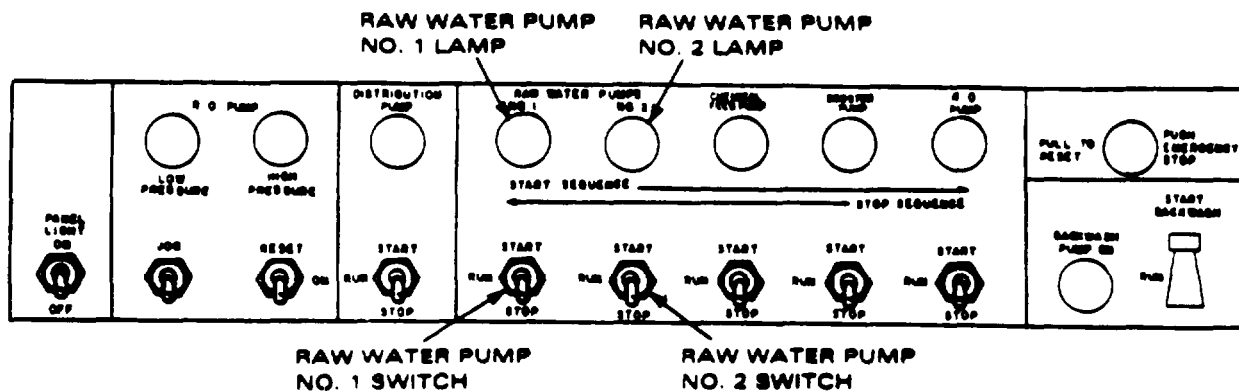

Figure 2-47. Switches (Pump Controls)

- d. Start RAW WATER PUMP NO. 1.
- (1) Set switch upward to START.
 - (2) Hold switch up until green lamp No. 1 comes on.
 - (3) Release switch.

- (4) Switch will return to RUN.
 - (5) Look at output hose from raw water pump No. 1. Hose goes into input connection of raw water pump No. 2. Hose should expand and straighten out.
- e. Start RAW WATER PUMP NO. 2.
- (1) Set switch upward to START.
 - (2) Hold switch until green lamp No. 2 comes on.
 - (3) Release switch.
 - (4) Switch will return to RUN.
 - (5) Look at output hose from raw water pump No. 2. Hose goes into lower right connection of ROWPU control panel. Hose should expand and straighten out.
 - (6) Check RAW WATER FLOW gage for 27-33 gpm.

Figure 2-48. Output Hose – Raw Water Pump No. 2

CAUTION

Pump valves should not be in OFF position at any time during chemical feed pump operation.

NOTE

If blue lamp, R.O. PUMP LOW PRESSURE, on control box assembly, stays on, then priming did not work. Set both RAW WATER PUMP switches to STOP. Prime raw water pump No. 1 again (as described above), then restart both pumps. Repeat priming if necessary until water starts flowing into the ROWPU.

f. On the control box assembly is a lamp labeled CHEMICAL FEED PUMP. Below the lamp is a switch. Hold switch at START until green lamp above it goes on. Release switch. Switch returns to RUN.

Figure 2-49. Chemical Feed Pump Start Switch

g. Ensure all four chemical feed control knobs are set to their maximum settings (Model No. 600-1: 10.0; Model No. 600-3: 8.5).

h. With the control knobs set at maximum, allow chemical pump motor to run with valve set to PRIME until no more air bubbles are seen in the solution flowing in the polymer hoses.

NOTE

If pump fails to prime, there may be some particles in the suction or discharge valves. Check Section II, Chapter 3, Troubleshooting.

i. When you can't see any more bubbles in either hose, calibrate the POLYMER flow as follows:

(1) For noticeably turbid (dirty or murky) source water, set POLYMER control knob to 2.6. Otherwise, set control knob to 1.0.

(2) Use the 100-ml graduated plastic cylinder out of Storage Box No. 3.

(3) While POLYMER pump is running, remove polymer return hose from container and catch flow for 1 minute.

(4) If knob was set to 2.6, flow should be about 60 ml/min. Adjust knob to obtain correct flow. Record knob setting for future reference.

Model No. 600-3

Model No. 600-1

Figure 2-50. Control Knobs

- j. When no more bubbles can be seen in SODIUM HEX and CHLORINE hoses, calibrate the flow as follows:
- (1) Set the SODIUM HEX control knob to 2.6.
 - (2) Remove return hose from chemical container.
 - (3) Catch chemical in 100 ml graduated cylinder (Storage Box No. 3)
 - (4) Adjust control knob until you get 60 ml/min. flow and record setting for future reference.
 - (5) Calibrate chlorine flow in same way.
 - (6) Do NOT yet turn valves to RUN; leave them in PRIME position.
- k. Leave CITRIC ACID control knob at maximum setting; no calibration is required for CITRIC ACID flow. Valve remains in PRIME position throughout normal operation.
- l. With both raw water pumps working, and the chemical feed pump running, set POLYMER pump valve from PRIME to RUN. Set VENT MULTIMEDIA FILTER valve to CLOSE as soon as a full stream of water flows out of vent pipe (located at bottom right-hand front of trailer, below R.O. pump belt guard).

NOTE

There should be air venting out of the pipe as the multimedia filter fills, followed by a steady stream of water when the filter is full. If not, the vent line is probably blocked by a small piece of filter media. Remove vent line from filter and blow compressed air through the line to dislodge the blockage.

Figure 2-51. Multimedia Filter Vent Valve

Figure 2-52. Booster Pump Switch

m. Start booster pump.

- (1) Set BOOSTER PUMP switch upward to START,
- (2) When green lamp comes on, release switch.
- (3) Switch will return to RUN.

(4) Set VENT CARTRIDGE FILTER valve to CLOSE as soon as a full stream of water flows out of vent pipe (located at bottom right-hand corner of frame below R.O. pump belt guard screen).

Figure 2-53. Cm Cartridge Filter Vent Valve

Figure 2-54. Controls, R.O. Pump

n. Start R.O. pump:

- (1) Make sure VENT PULSE DAMPENER VALVE (fig. 2-53) is open.
- (2) Set R.O. Pump RESET switch upward. R.O. pump LOW PRESSURE lamp goes OFF and switch returns to ON.
- (3) Hold R.O. PUMP switch upward to START.
- (4) As soon as R.O. PUMP green lamp comes on, release switch.
- (5) Switch will return to RUN.

Figure 2-55. R.O. Pump And Motor

(6) Set the VENT PULSE DAMPENER valve to CLOSE as soon as you see a full stream of water coming from the vent (located at the bottom right hand side of the unit below the R.O. pump screen belt guard).

Figure 2-56. Pulse Dampener Vent Valve

NOTE

The filtered water is bypassing the R.O. vessels.

Figure 2-57. R.O. Vessel

o. Observe the VENT VESSELS hose for water flow and clarity. Note that the water coming out of VENT VESSELS water hose is getting clearer and clearer. Within 10 minutes, water should be clear. As soon as water appears completely clean, proceed to step p.

WARNING

Vent vessels water flow is not potable. Run water downstream from raw water source as far away as possible.

p. Examine filtered water for clarity:

(1) From Storage Box No. 3, get the plastic graduated cylinder (called turbidity tube) used for checking clarity of water.

- (2) Bottom of turbidity tube has a white bullseye set in a black background disc.
- (3) Go to left front side of ROWPU and observe the seven drain valves.

Figure 2-58. Turbidity Tube

Figure 2-59. Drain Valves

- (4) Draw a sample of 600 milliliters of water from DRAIN NO. 1 CARTRIDGE FILTER into the turbidity tube.
- (5) Look down into turbidity tube and you should be able to see both the white bullseye and black disc at the bottom of the tube clearly. If they can be seen clearly, proceed to step q.
- (6) If both cannot be seen clearly, run the ROWPU another 10 minutes. Repeat steps (4) and (5).
- (7) If after second sampling test, water is not clear, readjust POLYMER chemical feed control knob setting by 0.5.

NOTE

The setting of 60 or 20 ml/min set earlier was only to prevent overdosing of polymer. This rate may be adjusted during operation to improve clarity.

(8) Run ROWPU for 5 minutes, and repeat steps (4) and (5). If both bullseye and black disc can be seen clearly, proceed to step r; if not, proceed to step (9).

(9) Increase control knob setting by 0.5.

(10) Repeat steps (8) and (9) until water is clear.

NOTE

Unless source water is noticeably turbid, it should not be necessary to increase POLYMER setting beyond 2.5.

- q. Set SODIUM HEX valve to RUN position (fig. 2-10).
- r. Check that the vent product water valve (fig. 2-6) is in the OPEN position. The vent product water valve allows air to escape from the product water line and lowers product water pressure. it should be closed once product water has been produced.
- s. Check that the REGULATE PRODUCT flow valve (3, fig. 2-64) is fully open.

NOTE

You are now ready for full operation under normal circumstances. A few more adjustments are required while you produce water and store it in tanks for future use.

- t. Slowly close VENT VESSELS valve located behind VENT VESSELS outlet. This allows filtered water to enter R.O. vessels.

Figure 2-61. R. O. Pressure And Product Water Flow Gages

u. Slowly adjust REGULATE PRODUCT FLOW valve (3) to the right. Watch for an increase in PRODUCT WATER FLOW gage (2), a decreased flow in BRINE FLOW gage (4), and increased pressure in the R.O. PRESSURE PSI gage (5).

CAUTION

PRODUCT WATER FLOW should not exceed 12 gpm for seawater conditions, 16 gpm for fresh or brackish water. R.O. PRESSURE PSI gage should not exceed 960 psi (seawater), 500 (fresh or brackish water). If gage readings exceed these limits, refer to Section II, Chapter 3, Troubleshooting.

Figure 2-62. Product Water Flow Gages And Pressure

v. Close REGULATE PRODUCT FLOW valve very slowly. Watch gages until you obtain proper balance shown in Table 2-4.

w. Set CHLORINE valve to RUN position (fig. 2-64).

x. The ROWPU is now in full operation. Check the TDS of the product water (para. 2-32c), record the findings in operator's log. If reading is above 1500 ppm, refer to Section II, Chapter 3, Troubleshooting. Keep watching your gages and lamps. Complete the operator's record (log) hourly. Refer to Table 2-4 for normal and trouble point indications.

Table 2-4. Gage Readings, Normal and Trouble-point

Gage/Indicator	Normal Reading	Trouble point reading
CARTRIDGE FILTER	1 to 20 psid	Over 20 psid
MULTIMEDIA FILTER	0 to 10 psid	Either over 10 psid or not within 5 psid of log reading at startup
RAW WATER FLOW	27 to 33 gpm	Drop to 25 gpm or less
BRINE FLOW	16 to 24 gpm	Below 15 gpm
PRODUCT WATER FLOW:		
SALT WATER	6 to 12 gpm	Above 12 gpm
FRESH WATER	Up to 16 gpm	Above 16 gpm
BRACKISH WATER	Up to 16 gpm	Above 16 gpm
R.O. PRESSURE PSI:		
SALT WATER	Not to exceed 960 psig	Above 960 psig
FRESH WATER	Not to exceed 500 psig	Above 500 psig
R.O. VESSELS	50 to 100 psid	Above 100 psid
TDS OF PRODUCT WATER	Below 1500 ppm	Above 1500 ppm

y. Periodically check the brine tank.

(1) Covered?

(2) Full? Up to 3 inches from top?

(3) When brine tank is full, remove the canvas brine hose coming from the ROWPU and allow to drain on the ground.

WARNING

Ensure that the drained brine water runs towards lower ground as far from the raw water source as possible.

- (4) Let brine flow on the ground until after next backwash, then put the hose back into tank.

Figure 2-63. Brine Water Shutoff Valve

NOTE

The R.O. VESSELS gage is a good indicator of the condition of the R.O. elements. Gage should read about 85 psid while R.O. elements are in good condition.

- z. Check R.O. PUMP LOW PRESSURE lamp in the upper left corner of control box assembly. It must be off while ROWPU is operating normally. If the blue lamp comes on, check Table 3-2 for troubleshooting procedures.

Figure 2-64. R.O. Pump Low Pressure Lamp

- aa. Check R.O. PUMP HIGH PRESSURE lamp in upper left of control box assembly. It must be off at all times while ROWPU is operating normally. If that blue lamp ever comes on, the R.O. pump will shutdown at once. (Other pumps will continue to run). Check Table 3-2 for troubleshooting procedures.

Figure 2-65. R.O. Pump High Pressure Lamp

ab. Watch water level in product water tanks.

- (1) Keep tanks covered.
- (2) To distribute water, start distribution pump.

ac. To start distribution pump.

- (1) Set DISTRIBUTION PUMP switch on control box assembly panel to START.
- (2) Green lamp comes on.
- (3) Run distribution pump until user has enough, then switch to STOP.
- (4) If product water tank is full, stop ROWPU until more water is needed. (See para. 2-31 for normal shutdown procedure.)

Figure 2-66. Distribution Pump Switch

2-26. BACKWASH OF MULTIMEDIA FILTER.

NOTE

The multimedia filter should be backwashes:

- After 20 hours of ROWPU operation, or
- Multimedia filter gage reading is over 10 psid, or
- Multimedia filter gage reading exceeds 5 psid of log reading at startup, or
- ROWPU is to be shut down.

a. General. The backwash cycle is an up-flow operation. Water flows from the bottom to the top of the tank and then out to drain through the backwash flow control, washing out turbidity and settling the filter bed. The filter has three separate backwash stages. The first stage of backwash is at 70 gpm to fluidize the bed. A second backwash stage begins at approximately 120 gpm, tumbles at the bed, and scours the particles against one another when the backwash diaphragm valve opens. The backwash diaphragm valve then closes, returning the backwash rate to 70 gpm to restratify the media bed. The rinse cycle is a down flow operation. Water flows from the top of the tank through the filter bed and out to drain. This displaces the backwash water in the tank, and preconditions the filter bed before the filter reaches the purge cycle. The purge cycle is rapid downflow rinse to remove turbidity from the bottom of the filter and recondition the filter bed prior to the return to service.

b. Backwash Timer and Multimedia Filter Control Valve (fig. 2-15). The direction and rate of water flow through the multimedia filter are controlled by the control valve and backwash diaphragm valve. The control valve consists of six diaphragms which open and close during the timer cycles of backwash, conditioned rinse, and service (service means normal ROWPU operation). As the backwash timer automatically changes cycles, its pilot valve changes position. When the backwash timer pilot valve changes position, it hydraulically closes and opens the diaphragms in the control valve. During the 120 gpm portion of the backwash cycle (referred to as "secondary backwash") the backwash timer solenoid valve sends water to the backwash diaphragm valve (located just under the control valve). This opens the backwash diaphragm valve, resulting in the higher rate of backwash water flow.

(1) Mechanical Timer (Model 600-1): The main components of the mechanical timer are the reconditioning knob, timer mechanism motor, four controller cams, pilot valve motor, white cam, and the auxiliary pilot switch. The reconditioning cycle, backwash, rinse, purge, and service operation begins when the backwash switch, located on the control panel, is manually placed in the ON position. The recharge lever solenoid in the timer is then energized and the level moves to the right, thus rotating the reconditioning knob. There is now a dead time from 2-5 minutes (the time is still running) before backwash begins. The timer motor drives the controller cams (4 cams). These cams, which are set at the factory, control the reconditioning cycle. Readjustment should not be required. Backwash is initiated when the micro switch for the bottom cam (black cam with numbers) falls in the cam slot. When the blade of the micro switch falls into the notch of the fourth cam, the white cam is in the service (SR) position. The pilot valve motor receives signals from the white cam. The pilot valve sends water to pressurize (close) control valve, or drains water (opens). The auxiliary pilot switch is used to start toe backwash pump. The switch is operated by activation of its lever arm by the raised button on the white controller arm.

(a) Open timer cover.

NOTE

The timer screws (1), dial pins (2), and pointer (3), on dial (4) are used in commercial applications to begin the backwash cycle at a preset time and day, but are not applicable to the ROWPU.

Figure 2-67. Mechanical Timer

(b) Check that the reconditioning knob is in the idle position (fig. 2-71).

NOTE

If backwashing is required within 4 hours of the previous backwash, it is necessary to manually rotate the reconditioning (recharge) knob in the idle position. If the knob is not in the idle position when the backwash switch is activated, backwash cycle will not be in proper sequence.

(c) Rotate the reconditioning knob clockwise to the Idle position as required.

Figure 2-68. Mechanical Timer Reconditioning Knob

(d) Push upon latch and remove timer mechanism. Place it in cover as shown.

AUXILIARY PILOT SWITCH

WHITE CAM
IN SR POSITION

GROUND SCREW

Figure 2-69. Mechanical Timer Mechanism

(e) Check that white cam is in the service (SR) position as shown.

(f) Rotate the white cam counterclockwise to the service (SR) position as required.

(g) Replace timer mechanism in case and close cover. The timer is ready for operation.

Figure 2-70. Solid-State Timer (Pilot Control Valve)

(2) Solid-State Timer (Model No. 600-3). The solid state timer is approximately 8 inches high, 10 inches wide and 6 inches deep. Protruding from the rear of the timer is the pilot controller and solenoid valve (fig. 2-73). Inside is a black RESET button and an INTERNAL INDICATOR knob mounted to a subpanel (view 1, fig. 2-74).

(a) Ensure INTERNAL INDICATOR knob is in the SERVICE position by pressing the black RESET button. The INTERNAL INDICATOR knob allows the position of the pilot controller valve to be changed manually, which is never necessary if timer is functioning properly. In any event, if pilot controller valve is not in SERVICE position, ROWPU cannot be backwashes using normal procedures. In fact, ROWPU will not even operate.

(b) Overcurrent protection is provided by an internal resettable semiconductor. In the event of an overload, the circuit breaker is reset by depressing the RESET button. If power loss erases the memory of the time control counter, an automatic homing circuit is incorporated into the system which returns the pilot controller to the service position whenever power is restored.

(c) Remove the subpanel to access the four 10-position rotary switches (view 2, fig. 2-74) used to set the duration (in minutes) of each phase of the backwash cycle. Ensure settings are as follows:

Switch	Function	Recommended Setting
SW 1-	Primary Backwash	2
SW 2-	Fast Rinse	6
SW 3-	Secondary Backwash	2
SW 4-	Conditioned Rinse	2

Figure 2-71. Solid-State Timer (Subpanel and Rotary Switches)

c. Normal Backwash.

- (1) Shut the ROWPU down in the normal way (para. 2-31).
- (2) Make sure R.O. ELEMENT CLEANING switch (fig. 2-42) on side of control panel is down.
- (3) Check water level in backwash tank. Tank should be full.
- (4) Ensure basket strainer in backwash pump is not clogged.
- (5) Open backwash tank valve.
- (6) Loosen draincock on bottom of backwash pump to prime pump.
- (7) Turn BACKWASH VALVE handle downward to BACKWASH.
- (8) (All models except 600-1) Press RESET button on backwash timer to ensure INTERNAL INDICATOR knob is in service position (view 1, fig. 2-74). (Model 600-1) Ensure white cam in mechanical timer is in SR position (fig. 2-72).
- (9) Push BACKWASH switch up to START position and release immediately.

CAUTION

Do not hold START BACKWASH switch up for more than 5 seconds to avoid damage to the controls.

- (10) When a steady stream of water flows from backwash pump draincock, close draincock.

NOTE

Mechanical timer is activated within 5 minutes after pushing START BACKWASH switch up. Solid-state timer will come on immediately. BACKWASH PUMP ON lamp will come on, pump will start and backwash water will flow through the multimedia filter and out the waste water hose. The multimedia filter gage needle will move fully to right. During backwash, the backwash water flow rate varies automatically from 0 to 70 to 120 gpm while washing and rinsing.

For the mechanical timer, backwash operation is automatic after the backwash pump is started and lasts about 15 minutes. With the solid-state timer, backwash lasts about 13 minutes.

- (11) When backwash is complete, BACKWASH PUMP ON Lamp will go off and multimedia gage will return to "0". When backwash pump shuts off, turn BACKWASH valve handle upward to left to NORMAL position. Close valve at brine water supply tank.

- (12) Start up the ROWPU after backwash in the normal manner (para. 2-25).

CAUTION

Since the multimedia filter uses brine water to backwash, it should not be drained or left inoperative following backwash without first flushing with raw water for 5 minutes. Flush by operating filter normally.

2-27. CITRIC ACID FEED. After 20 hours of full operation, feed citric acid solution into filtered water in order to maintain pH recommended for optimum R.O. process:

WARNING

Chemicals can cause sickness or even death if extreme care is not taken. Wear protective devices when working with these solutions.

- a. Put 0.75 pounds of citric acid into CITRIC ACID pail, using citric acid measure.
- b. Fill CITRIC ACID pail with 3 gallons of brine.
- c. Stir chemical and brine with wooden paddle, and pour solution into 5 gallon container.
- d. While the ROWPU is operating normally, set the citric acid chemical feed pump valve on RUN, and set chemical feed control knob to maximum setting – 10 (Model No. 600-1), 8.5 (Model No. 600-3).
- e. Wait for 10 minutes.

f. Draw a 250 ml water sample pie from brine hose at backwash tank and check for a pH reading of 5 to 8 (para. 2-30). If that reading is over 8, feed a new batch of citric acid chemical mixture, using 1.5 pounds citric acid mixed with 3 gallons brine.

g. Set CITRIC ACID PUMP valve to PRIME. Feed is completed.

2-28. R.O. ELEMENT CLEANING METHODS. It will be necessary to clean the R.O. elements to improve total dissolved solids (TDS) rejection, and reduce operating pressure (P.S.I.). Two methods of cleaning elements are available. One method, used most often, is to feed citric acid solution through the vessels (para. 2-29a). The second method is to circulate Triton X-100 soapy cleaning solution through the vessels (para. 2-29b). Triton X-100 is more effective for removing dirt and silt. The R.O. elements must be cleaned:

a. Whenever the pressure shown on R.O. PRESSURE P.S.I. indicator rises to above 960 for seawater or 500 for fresh water.

b. Product water output drops several gallons per minute on PRODUCT WATER FLOW indicator, with no change in raw water temperature.

c. BRINE FLOW increases noticeably, and the adjustment of REGULATE PRODUCT FLOW valve does not correct the BRINE FLOW indication.

d. When R.O. vessels pressure increases by 20% over initial reading.

2-29. R.O. ELEMENT CLEANING PROCEDURE.

a. Citric Acid Method.

CAUTION

R.O. ELEMENT CLEANING switch (fig. 2-42) must be in OFF position except while cleaning R.O. elements.

(1) First backwash multimedia filter (see para. 2-26).

WARNING

Be sure that the drained brine water runs toward lower ground as far downstream from the raw water source as possible.

Figure 2-72. Backwash Water Tank

(2) After backwashing, adjust brine water level in tank to 7 inches. You may have to drain water from tank or operate ROWPU normally until you obtain 7 inches.

(3) Check for 7-inch brine water level with telescoping aluminum mixing paddle. Paddle has a 7-inch mark for checking the brine depth.

(4) Remove backwash hose from outlet of the backwash pump and connect VENT VESSELS hose to outlet of the backwash pump.

NOTE

If in the past, when using the same source water, brine has been very alkaline, then more citric acid may be added to start; however, never let pH of brine drop below 3.5.

(5) Remove backwash hose from outlet of the backwash pump and connect VENT VESSELS hose to outlet of backwash pump.

(6) Make sure REGULATE PRODUCT FLOW valve is open.

(7) Open VENT VESSELS valve. This valve should remain open at all times except when producing purified water.

(8) Check to see that the valve on the bottom of backwash water tank is fully open (turned fully to the left until it stops).

(9) Remove product water hose (14, fig. 2-28) from product water tank and allow hose from ROWPU to drain on the ground. Leave brine water hose in backwash water tank.

NOTE

If element cleaning does not start, it maybe necessary to loosen draincock on backwash pump to purge air. Close draincock when pump is primed.

(10) Within a few seconds, BRINE FLOW indicator (16, fig. 2-4) should show a flow of 16 gpm or more.

CAUTION

If pH of water circulating through R.O. elements drops below 3.5, element membranes may be damaged.

(11) After 5 minutes, check pH (para. 2-32) of water discharging back into brine tank; it should be near, but not below, 3.5. If it isn't, add another pound of citric acid and stir until all granules are dissolved.

NOTE

If in the past, when using the same source water, brine has been very alkaline, then more citric acid may be added; however, never let pH of the water circulation through R.O. elements drop below 3.5.

(12) Continue checking pH and adding 1 lb of citric acid at 5 minute intervals until pH of water is near, but not below, 3.5.

(13) Allow citric acid solution to circulate for 45 minutes. Periodically check the temperature of the water discharging back into brine tank; use thermometer in Storage Box No. 2.

CAUTION

Temperature of solution will rise during element cleaning. At no time should it exceed 120°F. If temperature rises above 120°, stop recirculating citric acid solution and resume normal operation.

(14) Stop recirculation by pushing the ELEMENT CLEANING switch down to OFF.

(15) Remove VENT VESSELS hose from outlet of the backwash pump and connect BACKWASH WATER hose to backwash pump outlet.

WARNING

Drainage lagoon should be located downstream from unit.

(16) Drain citric acid solution into a shallow man-made lagoon a reasonable distance away from the unit. Close valve at discharge of brine water tank (para. 2-66).

(17) Perform startup procedure for normal filtering operation (para. 2-25).

(18) Allow the ROWPU to operate for 10 minutes with the brine and product water hoses out of the tanks with REGULATE PRODUCT FLOW valve fully open (turned fully to the left until it stops) to rinse the R.O. pressure vessels.

Figure 2-73. Product Water Flow Indicator

Figure 2-74. R.O. Pressure Gage

(19) Adjust REGULATE PRODUCT FLOW valve until PRODUCT WATER FLOW gage reads under 16 gpm (fresh/brackish water) or 12 (seawater), and R.O. PRESSURE PSI reads under 500 (fresh/brackish water) or 960 (seawater).

(20) Allow ROWPU to run 3 minutes, and check product water TDS (para. 2-30c).

NOTE

Some elements require 24-72 hours of operation before TDS decreases to acceptable standards. If TDS is still over 1500 ppm after cleaning, allowing ROWPU to run longer may lower TDS.

(21) Only after obtaining TDS level under 1500 ppm, place product water hose back into product water tank, above water level.

b. Triton X Detergent Method. Follow same procedures for CITRIC ACID METHOD (para. 2-29a), with following exceptions:

(1) In step (4), instead of citric acid, use 800ml(1500 gallon tank) or 2160 ml (3000 gallon tank) of overpacked SURFACTANT (Triton X detergent).

(2) In step (17), continue to rinse elements until you can no longer see suds in rinse water.

Figure 2-75. Product Water Totalizer

a. One revolution of dial equals 10 gallons of product produced.

b. The meter registers total as follows:

						0
--	--	--	--	--	--	---

Last digit is ZERO
and is constant (does not move)

c. After one revolution, a total of 10 gallons are produced and the meter will register:

					1	0
--	--	--	--	--	---	---

d. After two revolutions:

					2	0
--	--	--	--	--	---	---

d. After 10 revolutions:

				1	0	0
--	--	--	--	---	---	---

2-30. SHUTDOWN PROCEDURES. For normal shutdown, set valves and switches as shown in Table 2-5 and fig. 2-79.

NOTE

Index numbers follow order of Table 2-5. For order numbers 1,2,4 and 5 refer to figure 2-10, 2-7, 2-6 and 2-5, respectively.

Figure 2-76. Shutdown Position Of Control Panel Switches And Valves

CAUTION

Follow the exact order of shutdown steps in Table 2-5 to prevent damage to the ROWPU.

Table 2-5. Shutdown Position of Valve or Switch

Order	Valve or Switch	Position
1	CHEMICAL FEED PUMP (valves (fig. 2-60)	PRIME
2	CHEMICAL FEED CONTROL knobs (fig. 2-59	10.0 (Model 600-1) 8.5 (Model 600-3)
3	REGULATE PRODUCT FLOW valve	OPEN
4	VENT PRODUCT WATER valve	OPEN
<p style="text-align: center;"><u>CAUTION</u></p> <p>After opening the regulate product flow valve fully, wait 5 minutes before opening vent vessels valve.</p>		
5	VENT VESSELS valve	OPEN
6	VENT CARTRIDGE FILTER valve	OPEN
7	VENT PULSE DAMPENER valve	OPEN
8	VENT MULTIMEDIA FILTER valve	OPEN
9	R.O. PUMP switch	STOP
10	BOOSTER PUMP switch	STOP
11	CHEMICAL FEED PUMP switch	STOP
12	RAW WATER PUMPS NO. 2 switch	STOP
13	RAW WATER PUMPS NO. 1 switch	STOP

2-31. OPERATION OF AUXILIARY EQUIPMENT.

WARNING

Operating noise level of the generator set can cause hearing damage. Ear protectors, as recommended by the medical or safety officer, must be worn when working near set.

WARNING

Generator sets must not be operated in enclosed areas unless exhaust discharge is properly vented to the outside. Be alert at all times during operation for odors and exposure symptoms.

a. Generator Set (Army). Instructions for operating the generator are contained in the applicable generator set manual (TM 5-6115-465-12 for NSN 6115-00-118-1240).

b. Color Comparator Test Kit. Instructions to determine the pH values and chlorine residual in water are contained in the color comparator test kit (para. 2-17, fig. 2-14). The Diethyl-P-Phenylene Diamine (DPD) tablets are not part of the test kit, but are included in Storage Box No. 3.

c. TDS Meter (Portable). The TDS (total dissolved solids) meter is a calibrated meter that measures how much electric current can flow through a sample of water. Pure water passes almost no current.

(1) Description of the TDS meter:

- (a) Reads in ppm (parts per million) or in mg/l (milligrams per liter).
- (b) Has three scales: 0 to 5 x 10, 0 to 5 x 100, and 0 to 5 x 1000.
- (c) Change scales with the range switch.

Figure 2-77. Total Dissolved Solids (TDS) Meter

CAUTION

Always start with meter set on the 0 to 5 x 1000 scale. If you use a lower scale first, you may damage the meter.

NOTE

The TDS meter is factory calibrated and suitable for use when treating fresh (lake, stream, pond, river) water. When treating seawater and brackish water, it is necessary to recalibrate the meter. If your meter has both "442" and "NaCl" internal standards stamped on the bottom panel, obtain a standard sodium chloride (NaCl) solution (Army-SC-4610-97-CL-E16; MC - SL-3-08580A) and refer to subpara. (3).

(2) Recalibration instructions for meters with both internal standards (442 and NaCl) stamped on the bottom of the meter:

- (a) Set range switch to "S" (internal standard).
- (b) Remove bottom plate to gain access to master calibration control.
- (c) Press indicator button and hold it in.
- (d) Adjust the master calibration control with your finger until meter reads same as the value stamped on the bottom plate for the water you will be treating (442 for fresh water and NaCl for seawater).
- (e) Release indicator button.
- (f) Replace bottom plate.

(3) Recalibration instructions for meters with only "442" internal standard stamped on bottom plate:

- (a) Obtain a standard sodium chloride (NaCl) solution and note the ppm (parts per million) value printed on bottle.
- (b) Remove snap-in disc on bottom cover of TDS meter to gain access to the master calibration control.
- (c) Rinse cell cup three times with the standard sodium chloride (NaCl) solution, then fill again.
- (d) Set range switch to the 1000 scale.
- (e) Press indicator button and hold it in.
- (f) Adjust the master calibration control until the meter reads the value on solution bottle, then release indicator button. Remember to multiply meter reading by 1000.
- (g) Set range switch to "S" (internal standard).
- (h) Press indicator button, and hold it in.
- (i) Note the dial reading and write it down for future reference, then release indicator button. This value is the internal standard for a sodium chloride (NaCl) solution.
- (j) Replace snap-in disc in bottom cover.

(4) Calibration Check:

- (a) Set range switch to "S" (an internal standard).
- (b) Press indicator button. Read the 0 to 5 scale to the nearest tenth.
- (c) For fresh water, meter is ready for use if it matches the 442 ppm internal standard marked on bottom plate. For seawater or brackish water, meter is ready if its reading matches the "NaCl" internal standard, which if not stamped on bottom plate, was noted in step (3)(i).
- (d) If reading is not the same, notify unit maintenance to replace TDS meter.

CAUTION

To avoid shorting TDS meter, keep the meter dry. Do not spill water or any other liquid on the meter. Do not damage meter by removing or twisting cell cup.

NOTE

Be sure cell cup is clean; wash with soap and water if required.

(5) Testing.

(a) Rinse cell cup three times with water to be tested.

(b) Fill cell cup to 1/2 inch from top with water to be tested.

NOTE

Do not use range extender when testing product water.

(c) Push range extender into cup, seating the O-ring.

CAUTION

Always start with meter set on the 0 to 5 x 1000 scale. If you use a lower scale first, you may damage the meter.

(d) Set range switch to 0 to 5 x 1000 scale.

(e) Press indicator button. If reading is less than 500, switch to the 0 to 5 x 100 scale range. If reading is below 50, switch to 0 to 5 x 10 scale range.

(f) Record highest 0-to-5 reading by range factor used to get that reading (10, 100, or 1000) to get proper value in ppm or mg/l; record.

NOTE

If using the range extender, multiply this value by 10.

(g) Remove range extender and thoroughly rinse extender and cell cup using purest water available. Wipe dry with clean cloth.

2-32. PREPARATION FOR MOVEMENT.

NOTE

If operation will be reestablished within 3 days, cleaning R.O. elements is not required.

- a. Backwash MULTIMEDIA filter (para. 2-26) and clean R.O. elements (para. 2-29).
- b. Shut off ROWPU normally (para. 2-31).

- c. Remove strainer and hose from water source.
- d. Drain ROWPU pipes, filters, and connections:
 - (1) Open seven drain valves (para. 2-12b).
 - (2) Open five vent valves (para. 2-23b).
- e. Drain R.O. pump as described below:

CAUTION

To prevent damage to R.O. pump, do not operate R.O. PUMP JOG switch (42, fig. 2-4) more than 5 seconds at a time.

NOTE

The JOG switch can be used when the R.O. Pump LOW PRESSURE lamp is on.

(1) After water stops flowing out of drains, set R.O. PUMP JOG switch (42, fig. 2-4) to JOG. Hold it there for 3 to 5 seconds to force water from pump.

(2) Repeat operation of R.O. pump with JOG switch until no more water comes from the DRAIN PULSE DAMPENER drain (fig. 2-39). After jogging the R.O. pump, some dripping from the drain is allowable.

(3) (Model 600-1) Disconnect product water lines from R.O. vessels so they can drain. Reconnect lines when vessels are fully drained. (Model 600-3) Open front and rear sample valves all of the way to allow R.O. vessels to drain. Close when fully drained.

(4) Tag and disconnect the lines on the multimedia filter control valve (fig. 2-1 4) and backwash timer pilot valve, and allow lines to drain. After draining the lines, reconnect them to the valve as tagged.

- f. Drain booster pump:
 - (1) Run BOOSTER PUMP (fig. 2-56) for no more than 5 seconds.
 - (2) Set switch to STOP.
 - (3) Repeat the last two steps until no more water comes from cartridge filter drain (fig. 2-9).
- g. Drain chemical feed pumps as described below:

WARNING

Chemicals used for operating ROWPU can kill you. The chemicals alone or in mixture can be dangerous. Always wear protective clothing and make sure area is well ventilated.

- (1) Empty and rinse all chemical utility containers and fill them with brine water.

- (2) Set chemical pump valves to PRIME (fig. 2-63).
 - (3) Run pump motor (37, fig. 2-4) to rinse chemical pumps. Ensure all control knobs (fig. 2-7) are set to their maximum settings.
 - (4) Remove (Model 600-1) or disconnect (Model 600-3) intake hoses from all chemical containers.
 - (5) Allow pump to run for 5 to 10 seconds to empty water from chemical pumps.
 - (6) Stop pump motor and empty chemical containers.
 - (7) Drain all hoses.
 - (8) (Model 600-3) Ensure chemical containers are secure in rack and rack is secured inside ROWPU frame or on trailer.
- h. Drain Product Water Tanks and Pump:
- (1) Start and run distribution pump (40, fig. 2-3) until all water is drained from both product water tanks.
 - (2) Shut off distribution pump.
 - (3) Roll up electrical cord onto holder on pump.
- i. Drain Backwash Water Tank and Backwash Pump:

CAUTION

Use the ELEMENT CLEANING SWITCH (23, fig. 2-42) to start the backwash pump. Using the START BACKWASH SWITCH will cause the unit to go into the automatic backwash cycle.

- (1) Start and run backwash pump using ELEMENT CLEANING SWITCH, until all water is drained from brine water tank.
 - (2) Close backwash water (brine water) tank shutoff valve (fig. 2-66).
 - (3) Disconnect backwash suction hose at backwash pump.
 - (4) Open draincock on bottom of backwash pump. Drain pump and back wash strainer.
 - (5) Disconnect strainer and strap backwash strainer to frame of the pump.
 - (6) Close draincock on pump.
 - (7) Roll up electrical cord onto holder on pump.
- j. Drain Raw Water Pumps No. 1 and 2, and Distribution Pump:
- (1) Open pump vent valve (fig. 2-40).

- (2) Open pump drain valve (fig. 2-36).
- (3) Disconnect hoses, strainer and float.
- (4) Roll up electrical cords on pumps.
- k. Shut off Generator Unit according to applicable manual for generator.
- l. Prepare hoses, pumps, and tanks for movement:
 - (1) Disconnect all hoses from ROWPU panel and install caps on panel hose connections.
 - (2) Remove hoses from pumps (all except chemical feed pump) and separate hoses.
 - (3) Remove all hose adapters and distribution nozzle. Put adapters and nozzle into Storage Box

No. 2.

- (4) Roll all rubber hoses and connect the ends.
- (5) Drain and roll canvas hoses, starting with male end (male end goes on the inside, female end on the outside).
- (6) Put caps on all openings of portable pumps.
- (7) Remove covers from all water storage tanks. Fold covers.
- (8) Drain and deflate the three water storage tanks and remove all valves and adapters.

CAUTION

If any water remains in tanks, tip tanks and drain water. Dry tanks before folding.

- (9) Fold up tanks.
- (10) Fold up ground clothes.
- (11) Pull out ground rods using slide hammer and store on ROWPU control panel (fig. 2-37).
- m. Refer to loading plan attached to each storage box lid and pack accessories as indicated. Be sure TDS meter is packed in its case and is secure in Storage Box No. 2.
- n. Install pumps, storage boxes, pails, hoses, sledge hammer, aluminum paddle, and tanks on ROWPU. Refer to paragraph 1-6, (fig. 1-3 through 1-15) as a general packing guide.
- o. (Army) Install trailer cross braces.

p. (Army) Refer to fig. 2-81 and prepare trailer for movement.

CAUTION

In order to release trailer air brake system, towing vehicle must have 90-130 psi of air pressure.

1. REMOVE NUTS (1) AND SCREWS (2) SECURING SAFETY STEP IN PLACE, LIFT STEP UP AND FOLD END PLATE (3) UNDER PLATE (4). LAY BOTH PLATES BACK DOWN AND FASTEN BOTH TO TRAILER DRAWBAR (5); WITH SECURING NUTS (1) AND SCREWS (2).

Figure 2-78. Preparation for Movement (Sheet 1 of 5) (Army Model No. 600-1)

2. REMOVE SAFETY PIN (6) AND CRANK HANDLE (7) FROM REAR OF JACK SUPPORT BRACKET (8).

3. POSITION CRANKHANDLE (7) ON REAR JACK (9) AND TURN HANDLE COUNTERCLOCKWISE TO RAISE JACK PAD (10).

4. REPLACE CRANK HANDLE (7) ON REAR OF JACK SUPPORT BRACKET (8); INSTALL SAFETY PIN (6).

5. TO ROTATE REAR LEVELING JACKS TO HORIZONTAL POSITION. PULL OUT SPRING-LOADED LOCKING PIN (11) ON JACK SWIVEL ASSEMBLY (12); ROTATE JACK (9) TO HORIZONTAL (STOWED) POSITION. ALLOW LOCKING PIN (11) TO SPRING BACK TO LOCKED POSITION.

Figure 2-78. Preparation for Movement (Sheet 2 of 5) (Army Model No. 600-1)

6. REMOVE SAFETY PIN (13) AND CRANKCASE HANDLE (14) FROM REAR OF JACK SUPPORT BRACKET (15).

7. PLACE CRANK HANDLE (14) ON FRONT JACK (16). SLOWLY BACK TOWING VEHICLE (17) INTO POSITION SO THAT LUNETTE (18) ALIGNS WITH PINTLE (19). RAISE OR LOWER FRONT OF TRAILER, AS NECESSARY, TO POSITION LUNETTE (18) IN PINTLE (19). CLOSE PINTLE (19) AND SECURE TRAILER SAFETY CHAIN (20) TO TOWING VEHICLE (17).

Figure 2-78. Preparation for Movement (Sheet 3 of 5) (Army Model No. 600-1)

6. WITH CRANK HANDLE (14) IN POSITION ON FRONT JACK (16), TURN CRANK HANDLE (14) COUNTERCLOCKWISE AND FULLY RAISE JACK PAD (21).

9. REPLACE CRANK HANDLE (14) ON REAR OF JACK SUPPORT BRACKET (15); INSTALL SAFETY PIN (13).

10. PULL OUT SPRING-LOADED LOCKING PIN (22) ON JACK SWIVEL ASSEMBLY (23); ROTATE JACK (16) TO HORIZONTAL (STOWED) POSITION, ALLOW LOCKING PIN (22) TO SPRING BACK TO LOCKED POSITION.

11. REMOVE AIR HOSES (24) FROM DUMMY COUPLINGS (26) ON TRAILER DRAWBAR (26) AND CONNECT THEM TO TOWING VEHICLE.

Figure 2-78. Preparation for Movement (Sheet 4 of 5) (Army Model No. 600-1)

12. REMOVE ELECTRICAL CONNECTOR (27) FROM STOWAGE CLIP (28) ON TRAILER DRAWBAR (26) AND CONNECT IT TO MATING RECEPTACLE (23) ON TOWING VEHICLE.

13. DEPRESS BRAKE PEDAL (30) OF TOWING VEHICLE (17); OBSERVE THAT BLACKOUT-STOPLIGHT (31) AND TAIL LIGHT-STOPLIGHT ASSEMBLIES (32) AS WELL AS BRAKES OPERATE CORRECTLY, IF LIGHTS AND BRAKES OPERATE CORRECTLY, TRAILER IS READY FOR TRANSPORTING.

Figure 2-78. Preparation for Movement (Sheet 5 of 5) (Army Model No. 600-1)

SECTION IV. OPERATION UNDER UNUSUAL CONDITIONS

NOTE

Refer to applicable manuals for operation of power generating equipment during unusual conditions.

NOTE

References to trailer are for Army Model 600-1 only.

2-33. FORDING. No special procedures are required before or during fording. After fording, wash the trailer with fresh water to remove mud and other contaminants as soon as it is convenient to do so. Pay special attention to the electrical connections and brake hoses, the springs, and the suspension assembly. Lubricate the entire vehicle in accordance with the instructions in the Lubrication Order, LO 10-4610-239- 12/LI 08580A-12.

2-34. EMERGENCY PROCEDURES. If the air supply from the towing vehicle and from the trailer air reservoir should be interrupted, the emergency spring brakes will lock. Refer to fig. 2-82 as required to reset a locked spring brake.

2-36. WATER DEPTH/WAVE CONDITIONS. When waves of 2-4 feet at water source exist, or when water depth is too low to prevent sand or debris from entering strainer at water source, it will be necessary to backwash multimedia filter more often.

WARNING

Generator set must not be operated in enclosed areas unless exhaust discharge is properly vented to the outside. Death by suffocation due to carbon monoxide is possible if this warning is not heeded.

2-38. COLD WEATHER. Locating, installing and operating the equipment at subfreezing temperatures requires taking precautions. Adequate shelter and heating are required when operating in temperatures below 32° F (0°C). When locating the equipment take advantage of existing shelter and windbreaks. Erect tenting shelters for protection. The filtered water storage tanks may be installed inside a tent or other shelter. Filtered water may be recirculated with the distribution pump between the two filtered water storage tanks to prevent freezing in the hose lines, tank outlets and pump. Fuel, coal or wood burning heaters or other heating devices may be installed inside the erected tents to protect the equipment and prevent freezing of water. When the equipment is to be shutdown, all hoses must be disconnected from pumps, and all pumps, hoses, pipes and tanks drained quickly. All drain and vent valves must be opened and all equipment inspected to assure complete drainage. During cold weather, keep in mind the following warnings, cautions and procedures:

CAUTION

Turn valves slowly during cold weather, because metal contracts and becomes very brittle.

- a. Inspect the ROWPU closely for split or frozen hoses, dogged strainer, etc.

WARNING

To prevent hands from freezing to metal, wear rubber gloves when handling and setting valves.

1. REMOVE DUST CAP (1) FROM TOP OF SPRING CHAMBER (2). REMOVE RELEASE STUD ASSEMBLY FROM SIDE SLEEVE (3) BY REMOVING RELEASE STUD NUT (4) AND WASHER (5) FROM RELEASE STUD (6) AND SLIDING RELEASE STUD OUT OF SLEEVE.

2. INSERT RELEASE STUD (6) THROUGH OPENING (WHEN DUST CAP REMOVED) OF SPRING CHAMBER (2) AND INTO THE PRESSURE PLATE (7). TURN RELEASE STUD (6) 1/4 TURN (CLOCKWISE) INTO PRESSURE PLATE (7) TO SECURE CROSSPIN (8) IN CROSSPIN AREA OF PRESSURE PLATE (7), THEN LOCK RELEASE STUD INTO MANUAL RELEASE POSITION.

3. PLACE PREVIOUSLY REMOVE RELEASE STUD WASHER (5) AND NUT (4) ON RELEASE STUD (6) AND HAND TIGHTEN THE NUT ONTO RELEASE STUD

CAUTION

DO NOT APPLY TORQUE GREATER THAN 50 FT-LBS (6.9M-KG) TO RELEASE STUD ASSEMBLY.

USE TORQUE WRENCH (9) TO TURN RELEASE STUD NUT (4) CLOCKWISE UNTIL COMPRESSION SPRING (10) IS FULLY CAGED. WHILE COMPRESSION SPRING (10), OBSERVE THAT SERVICE PUSH ROD (11) IS RETRACTING AS RELEASE STUD NUT (5) IS BEING TIGHTENED. WHEN COMPRESSION SPRING (10) IS FULLY CAGED, SPRING BRAKE IS MECHANICALLY RELEASE.

4. AFTER OPERATIONAL AIR PRESSURE BUILDS UP IN BRAKE CHAMBER AIR RESERVOIR. REMOVE RELEASE STUD ASSEMBLY FROM SPRING CHAMBER (2) AND STOW IN SIDE SLEEVE (3), BY INSERTING RELEASE STUD (6) THROUGH SIDE SLEEVE (3) AND INSTALL WASHER (5) AND NUT (4). REPLACE DUST CAP (1) IN SPRING CHAMBER (2).

Figure 2-79. Resetting Locked Spring Brake (Army)

CAUTION

If raw water hoses freeze, poor water flow will reduce pressure in R.O. pump. The R.O. PUMP LOW PRESSURE lamp will come on and R.O. pump will shut itself off. Bring hoses under cover until ice melts.

NOTE

The ROWPU produces less product water when the temperature of raw water drops.

b. When the ROWPU is shut down during cold weather (temperature falls below 32 °F (0 °C), remove the R.O. elements (para. 3-4) . Store the elements indoors or in a tent where the temperature is above freezing and allow them to dry. Drain all water from ROWPU as follows:

WARNING

Make sure drained water runs toward lower ground (downstream) as far from the raw water source as possible.

(1) Drain ROWPU pipe, filters, and connections:

(a) Open seven drain valves (para. 2-38).

(b) Open five vent valves (para. 2-23 b).

(c) Facing trailer from towing end, jack-up left side to permit maximum water drainage through drain valves.

(2) Drain R.O. pump as described below:

CAUTION

Do not operate R.O. PUMP JOG switch (42, fig. 2-4) for more than 5 seconds at a time. You will damage pump if you do.

NOTE

The JOG switch can be used when the R.O. pump LOW PRESSURE lamp is on.

(a) After water stops flowing out of drains, set R.O. PUMP JOG switch to JOG. Hold it there for 3 to 5 seconds to force water from pump.

(b) Repeat operation of R.O. PUMP with JOG switch until no more water comes from the DRAIN PULSE DAMPENER drain (fig. 2-39).

(c) Disconnect plastic tubing from bottom of R.O. vessels so they can drain. Reconnect tubing when vessels are fully drained.

(d) Tag and disconnect the lines on the multimedia filter control valve (fig. 2-15) and backwash timer pilot valve and allow lines to dry. After draining the lines, reconnect them to valves as tagged.

(3) Drain booster pump:

(a) Run BOOSTER PUMP for no more than 5 seconds (fig. 2-55).

(b) Set switch to STOP.

(c) Repeat the last two steps until no more water comes from cartridge filter drain (fig. 2-39).

(4) Drain chemical feed pumps as described below:

WARNING

Chemicals can cause sickness or death if extreme care is not taken. Wear protective devices when working with these solutions.

CAUTION

To avoid staining, be careful not to spill any solution on clothes or equipment. If any solution is spilled, it should be washed away immediately with water.

(a) Empty and rinse all chemical containers and fill them with brine water.

(b) Set chemical pump valves to PRIME (fig. 2-60).

(c) Run pump motor to rinse chemical pumps. Set all control knobs (fig. 2-10) to maximum setting.

(d) Remove intake tubing from all chemical containers.

(e) Allow pump to run (37, fig. 2-4) for 5 to 10 seconds to empty water from chemical pumps.

(f) Stop pump motor and empty chemical containers.

(g) Set chemical pumps valves to off position.

(h) Remove all tubing from pump and drain.

(5) Drain distribution pump and raw water pumps No. 1 and No. 2:

(a) Disconnect inlet and outlet hoses.

(b) Tip pump toward each connection to permit drainage.

(c) Open pump vent valve (fig. 2-40).

(d) Open pump drain valve (fig. 2-36).

- (e) Run pumps (36-40, fig. 2-4) for less than 5 second intervals until all water is out.
- (f) Shut off pumps.
- (6) Drain backwash pump:
 - (a) Disconnect backwash suction hose at backwash pump.
 - (b) Open draincock on bottom of backwash pump. Drain pump and backwash strainer.
 - (c) Close draincock on pump.

2-37. HOT WEATHER

- a. When the air temperature is 90°F (32 °C) or above, park in the shade and leave canvas cover over the ROWPU. Leave control panel uncovered.

NOTE

The motors will automatically shut off if they overheat.

- b. Check raw water and product water more often during hot weather.

NOTE

Plant life in water will clog multimedia filter and, therefore, reduce time between filter backwashings during hot weather.

- c. Visually check wire insulation carefully for damage.

2-38. DUSTY AND SANDY AREAS

- a. Protect equipment. Leave side covers down except over control panel.
- b. Keep ground around ROWPU damp to prevent loose, blowing sand and dirt.
- c. Cover all water storage tanks.

2-39. RAINY AND DAMP AREAS

CAUTION

To avoid electrical shorts, keep electrical items dry.

- a. Provide good water drainage.
- b. Protect chemicals.

2-40. SALTWATER AREAS

- a. When preparing for movement after saltwater operations, perform PREPARATION FOR MOVEMENT procedure (para. 2-33a).

b. After backwash is completed, drain brine tank and set chemical feed control valves to prime. Place the product water discharge hose into the brine water tank. Operate the ROWPU to produce nonchlorinated product water (minimum 1,000 gallons).

c. When the tank is full or the minimum requirement is met, shut down the ROWPU (para. 2-31).

d. Remove the raw water strainer and hose from the source and place it in the tank of NONCHLORINATED product water.

e. Follow INITIAL ADJUSTMENTS AND CHECKS (para. 2-23) and OPERATING PROCEDURE (para. 2-25), except for moving the chemical feed valves to run (NO CHEMICALS SHOULD BE INJECTED INTO THE SYSTEM DURING THIS PROCEDURE), until the nonchlorinated tank is empty.

f. Shut down the ROWPU following SHUTDOWN PROCEDURES (para. 2-31).

This procedure should be used to flush the salt deposits and bacteria from the system and the R.O. elements. By flushing this from the system, it slows corrosion and bacterial growth.

2-41. NUCLEAR OR CHEMICAL CONTAMINATED AREAS

a. The ROWPU has overpack items which are used as a posttreatment when nuclear or chemical contaminants are present. The equipment consists of a cartridge to remove nuclear contaminants, a cartridge used to remove chemical contaminants, and the adapters, bushings, clamps, couplings, reducers, and tubing needed for assembly.

WARNING

Radioactive contaminants are potentially hazardous. Use extreme care in replacing cartridges and follow safe procedures in their handling and disposal.

NOTE

Do not operate chlorination feed pump during NBC operation.

b. For nuclear, biological OR chemical contamination, use BOTH the cartridge marked "FOR USE WITH RADIOACTIVE CONTAMINATED WATER ONLY" AND the cartridge marked "FOR USE WITH CHEMICALLY CONTAMINATED WATER ONLY."

c. Exchange the inlet and outlet raw water pump adapter which is used in the NBC system and prepare to assemble NBC filters between two raw water tanks as shown in figure 2-83.

Figure 2-80. Nuclear and Chemical Filter Installation

d. Use one of the raw water pumps to force the water through the NBC cartridges. Install raw water pump (fig. 2-83).

- (1) Install 1 1/2 in. suction hose from raw water tank and swivel adapter on raw water pump.
- (2) Attach female end of distribution (suction or discharge) hose to straight adapter on raw water pump.
- (3) Attach swivel adapter to gate valve and attach male end of distribution hose to swivel adapter.
- (4) Attach shoulder bushing and adapter to gate valve.

NOTE

The NBC cartridges should be positioned so that the cartridge marked "FOR USE WITH CHEMICALLY CONTAMINATED WATER ONLY" is **FIRST** in the series. Position the cartridge marked "FOR USE WITH RADIOACTIVE CONTAMINATED WATER" so that water is filtered through this cartridge **LAST** as shown in figure 2-83.

- e. Assemble the NBC cartridge in series (fig. 2-83).

WARNING

Be sure to follow the setup procedures in steps 1 through 4 below. Pay special attention to the INPUT and OUTPUT labels on the top of the NBC cartridges when connecting the 3/4 in. reinforced flexible tubing to the cartridges.

- (1) Slide clamp over end of one section of 3/4 in. x 80 in. flexible tubing. Attach tubing to adapter on gate valve and close clamp.
- (2) Slide clamp over other end of tubing.
- (3) Remove plug from INLET port on FOR USE WITH CHEMICALLY CONTAMINATED WATER cartridge and insert adapter.
- (4) Attach tubing to adapter on INLET port and close clamp.
- (5) Cut one section of 3/4 in. x 80 in. flexible tubing to a maximum length of 24 in.
- (6) Slide clamp over end of tubing.
- (7) Remove plug from OUTLET port on FOR USE WITH CHEMICALLY CONTAMINATED WATER cartridge and insert adapter into cartridge.
- (8) Attach tubing to adapter on OUTLET port and close clamp.
- (9) Remove plug from INLET port on FOR USE WITH RADIOACTIVE CONTAMINATED WATER cartridge and insert adapter into cartridge.
- (10) Slide clamp over end of tubing.

- (11) Attach tubing to adapter on INLET port and close clamp.
- (12) Slide clamp over end of second section of 3/4 in. x 80 in. flexible tubing.
- (13) Remove plug from OUTLET port on FOR USE WITH RADIOACTIVE CONTAMINATED WATER cartridge and insert adapter.
- (14) Attach tubing to adapter on OUTLET port and close clamp.
- f. Complete connection of NBC cartridge to second raw water tank (fig. 2-83).
 - (1) Slide clamp over remaining end of 3/4 in. x 80 in. flexible tubing.
 - (2) Insert adapter into tubing and close clamp.
 - (3) Attach shoulder bushing, pipe coupling, and straight adapter to 1 1/2 in. discharge hose and connect to second raw water tank (fig. 2-83).

NOTE

Do not operate chlorination feed pump during NBC operation.

- g. During NBC operation, it is necessary to chlorinate the second tank by hand.
- h. With the exception of the chlorination feed pump, operate the ROWPU using normal operating procedures.
- i. Change the cartridges after every 100 hours of operating time.

CHAPTER 3
MAINTENANCE INSTRUCTIONS
Section I. LUBRICATION INSTRUCTIONS

3-1. LUBRICATION ORDER. For lubrication instructions for the flatbed cargo trailer and ROWPU refer to Lubrication Orders LO 10-4610-215-12/LI 08580A-12.

Section II. TROUBLESHOOTING PROCEDURES

3-2. TROUBLESHOOTING TABLE. To troubleshoot, refer to Tables 3-1 and 3-2.

a. Each table lists the common malfunctions which may be encountered during the operation or maintenance of the flatbed trailer and the ROWPU. Perform the tests/inspection and corrective actions in the order listed.

b. This manual cannot list all malfunctions that may occur, nor all tests or inspections and corrective actions. If a malfunction is not listed or is not corrected by listed corrective actions, notify the appropriate supervisor.

Table 3-1. (Army) Troubleshooting

MALFUNCTION	
TEST OR INSPECTION	
CORRECTIVE ACTION	
ELECTRICAL (TRAILER)	
1. LIGHTS DON'T WORK.	
Step 1.	Manually check trailer cable for proper connection to receptacle on towing vehicle.
	Connect cable properly.
Step 2.	Visually check both receptacle on towing vehicle and plug on cable to be sure all contacts are free of dirt, oil, and other contaminants.
	Check for damaged receptacle.
	a. Clean all connectors to remove corrosion and contaminants.
	b. If receptacle is damaged, refer to unit maintenance.
Step 3.	Visually and manually check wiring harness for loose or corroded connections, or damaged cable.
	a. Tighten loose connections.
	b. Clean corroded connections.

Table 3-1. (Army) Troubleshooting

MALFUNCTION

TEST OR INSPECTION

CORRECTIVE ACTION

c. If cable is damaged, refer to unit maintenance.

Step 4. Visually check ground connection at receptacle and check ground wire to towing vehicle.

If ground wire is loose or making poor contact, reposition wire and tighten connections.

Step 5. Visually check all lamps.

a. Replace all burnt out lamp(s).

b. If lamps are not defective, notify unit maintenance of trouble.

2. LIGHTS OPERATE INTERMITTENTLY.

Step 1. Visually and manually check cable assembly connectors and towing vehicle mating receptacle connections for proper contact.

Tighten all connectors to ensure proper contact.

Step 2. Visually check all contacts for contaminants such as oil, water, dirt, and corrosion.

Clean all connectors to remove corrosion and contaminants.

Step 3. Visually check entire cable assembly for partially severed cable.

If cable is damaged, refer to unit maintenance.

Step 4. Check that ground wires on trailer and towing vehicle are making proper contact.

Clean ground wire connections and secure tightly as necessary.

3. LIGHTS ARE DIM.

Step 1. Check trailer cable to be sure there are no damaged or broken wires, or corrosion on contacts. Check ground wire on both the trailer and on the towing vehicle.

a. If cable is damaged, refer to unit maintenance.

b. If cable is not damaged, clean all contacts to remove contaminants.

c. Clean and tighten ground connections.

Step 2. Check that correct lamps are installed, and securely seated in their sockets.

a. Replace incorrect lamps with correct type.

Table 3-1. (Army) Troubleshooting (continued)

MALFUNCTION	TEST OR INSPECTION	CORRECTIVE ACTION
		<p>b. Tighten lamps found loose in their sockets.</p> <p>c. If trouble is still present, refer to unit maintenance.</p>
4. WRONG LIGHT GOES ON.		
	Step 1.	<p>Will require a check of the cable assembly coding and voltages.</p> <p>Notify unit maintenance.</p>
AIR BRAKE SYSTEM (TRAILER)		
1. SYSTEM INOPERATIVE.		
	Step 1.	<p>Inspect air line hookup to be sure lines are not crossed.</p> <p>Disconnect air lines and reconnect correctly.</p>
	Step 2.	<p>Listen for escaping air, and locate defective line or fixture.</p> <p>Notify unit maintenance.</p>
	Step 3.	<p>Check the air system of the towing vehicle for leaks or lack of pressure.</p> <p>Notify unit maintenance.</p>
2. BRAKES REMAIN LOCKED.		
	Step 1.	<p>Check for cause of the lack of air pressure.</p> <p>Notify unit maintenance.</p>
	Step 2.	<p>Check the operation of the emergency/relay valve.</p> <p>Notify unit maintenance.</p>
	Step 3.	<p>Check to see if the compression springs have locked the brakes (wheels will not turn if springs have locked).</p> <p>Locate and correct the cause of the loss of air pressure; then refer to figure 2-81 in this manual for instructions for resetting a locked spring brake.</p>

Table 3-1. (Army) Troubleshooting (continued)

MALFUNCTION	
TEST OR INSPECTION	CORRECTIVE ACTION
3. BRAKES ON ONE SIDE ENGAGE BEFORE THOSE ON THE OTHER SIDE.	
Step 1.	Check the movement of the slack adjusters to see if they are out of adjustment. Notify unit maintenance.
Step 2.	Check the brake camshaft movement to see if there is any restriction on movement. Notify unit maintenance.
4. BRAKES SLIP.	
Step 1.	Check brake adjustment, and inspect for defective brake assembly parts. Notify unit maintenance to adjust brakes or replace defective parts.

Table 3-2. Troubleshooting (ROWPU)

MALFUNCTION	
TEST OR INSPECTION	CORRECTIVE ACTION
1. ANY GREEN PUMP LAMP GOES OFF.	
Step 1.	Check to see if associated pump is operating. For R.O. pumps, see if sheave is turning; for other pumps, rest hand lightly on the motor casing to feel for motor vibrations. <ul style="list-style-type: none"> a. If pump is not operating, check and reset circuit breaker (fig. 2-4 sheet 3 of 3) and then immediately try to restart pump. Do so only one time. b. If pump fails to start, notify unit maintenance. c. Shut down ROWPU in normal manner (para. 2-31) except when only one raw water pump fails or distribution pump fails. In these two cases the ROWPU can still be operated.

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION	TEST OR INSPECTION	CORRECTIVE ACTION
	Step 2.	<p>If pump is operating, check indicator lamp to see if bulb is burned out.</p> <ul style="list-style-type: none"> a. Replace defective bulb using lamp puller (para. 3–10). b. If bulb is not defective, notify unit maintenance.
2. RAW WATER FLOW INDICATOR DROPS TO NEAR ZERO; BOTH RAW WATER PUMP GREEN LAMPS ARE ON.		
	Step 1.	<p>Check to see that both raw water pumps are operating. Listen to motor and rest hand lightly on motor casing to feel for vibration.</p> <ul style="list-style-type: none"> a. If pump is not operating, check and reset circuit breaker (fig. 2-4, sheet 3 of 3) and then immediately attempt to restart. Do so only one time. b. If pump fails to start, notify unit maintenance and remove defective raw water pump from cycle.
	Step 2.	<p>Check for loose hose connections or damaged hose sections.</p> <ul style="list-style-type: none"> a. Tighten loose connections. b. Replace damaged hose sections.
	Step 3.	<p>Check to see if input strainer is completely under water.</p> <ul style="list-style-type: none"> a. Lengthen strainer rope. b. Move intake to deeper water.
	Step 4.	<p>Check to see if input strainer is clogged.</p> <ul style="list-style-type: none"> a. Clean debris from input strainer. b. Shorten strainer rope so it does not rest on bottom of raw water source. c. Make sure raw water pump is sufficiently close to raw water source.
3. CARTRIDGE FILTER GAGE RISES ABOVE 20 PSID.		
	Step 1.	<p>Make a turbidity tube check (para. 2–24p) of water taken from DRAIN NO. 1 CARTRIDGE FILTER valve (Fig. 2-39).</p>

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION	TEST OR INSPECTION	CORRECTIVE ACTION
		<p>a. If water is turbid, shut down ROWPU in normal manner (para. 2–29) and change cartridge filter elements (para. 3–5).</p> <p>b. If water is clear, notify unit maintenance because gage may be defective.</p>
<p>4. REDUCED PRODUCT WATER FLOW; R.O. PRESSURE PSI ADJUSTED TO 960 FOR SALTWATER, 500 FOR FRESH AND BRACKISH WATER.</p>		
NOTE		
<p>ROWPU produces less product water when raw water source temperature drops (3 % less per degree Celsius drop).</p>		
<p>Step 1. Check R.O. vessels for leaks caused by loose end caps or defective end cap O-rings.</p>		
<p>a. Tighten loose nuts (para. 3-4h(15)).</p>		
<p>b. Replace defective end cap O-rings (see para. 3-4c – elements need not be replaced).</p>		
<p>Step 2. Check R.O. vessel gage for reading higher than 100 psid.</p>		
NOTE		
<p>Membrane scaling may cause reduced product water flow without increasing R.O. vessel pressure. Cleaning elements when vessel pressure is under 100 psid may improve flow.</p>		
<p>a. Clean R.O. elements (para. 2–28).</p>		
<p>5. PRODUCT WATER FLOW READING RISES ABOVE 16 GPM (FRESH/ BRACKISH), 12 (SEAWATER) AND CANNOT BE LOWERED USING REGULATE PRODUCT FLOW VALVE.</p>		
<p>Step 1. Check the TDS of product water from each R.O. vessel as follows:</p>		
<p>a. (Model 600-3) - Use sample valves to collect product water sample. Do NOT disconnect product water hoses.</p>		
<p>b. (Model 600–1) – Sample valves are not available.</p>		

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION	TEST OR INSPECTION	CORRECTIVE ACTION
-------------	--------------------	-------------------

WARNING

Take care in disconnecting product water hose. Water is under pressure and will discharge rapidly.

Disconnect product water hose from one vessel at a time to collect product water.

- c. Check TDS sample from each R.O. vessel using TDS meter without range extender (para. 2-32c(5)).
- d. Use these findings to make a chart like the following:

R.O. Vessel	TDS (ppm)
1 (Top)	600
2	900
3	1100
4 (Bottom)	1400

NOTE

The numbers on this chart are examples only. Yours may vary.

- e. Examine pattern of chart. TDS should get larger from top to bottom.
 - (1) If any R.O. vessel does not follow this pattern, there is something wrong inside; disassemble the faulty vessel and replace defective items (see para 3-4).
 - (2) If R.O. vessels all follow this pattern, proceed to Step 3.

Step 2. Check product water flow from each R.O. vessel:

- a. Use same method as in Step 1 to collect water sample, but this time measure the time in minutes it takes to fill a 3-gallon bucket with product water from each vessel. Divide 3 by the number of minutes.

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION	TEST OR INSPECTION	CORRECTIVE ACTION
--------------------	---------------------------	--------------------------

b. Make a chart like the following:

R.O. Vessel	FLOW (gpm)
1 (Top)	4
2	3
3	2
4 (Bottom)	1

c. Examine your chart for a similar pattern, Flow should get smaller from top to bottom.

- (1) If any R.O. vessel does not follow this pattern, disassemble that vessel and replace defective items (para. 3-4).
- (2) If all vessels follow this pattern, notify unit maintenance to check for defective PRODUCT FLOW indicator.

6. R-O. PRESSURE PSIG GOES ABOVE 960 PSI IN SALTWATER OPERATION, 500 IN FRESH OR BRACKISH WATER OPERATION.

Step 1. Check TDS of product water (para. 2-32c(4)).

- a. If TDS over 1500 ppm, shut down ROWPU in normal manner (para. 2-29) and clean R.O. elements (para. 2-28).
- b. If TDS below or at 1500 ppm, notify unit maintenance of possible defective gage.

7. BACKWASH PUMP RUNS CONTINUOUSLY.

Step 1. Check position of R.O. ELEMENT CLEANING switch. Switch must be off except during R.O. element cleaning.

Turn ELEMENT CLEANING switch to OFF position.

Step 2. Notify unit maintenance to troubleshoot BACKWASH TIMER and its electrical wires.

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION	TEST OR INSPECTION	CORRECTIVE ACTION
8. BACKWASH WATER FLOW READING DROPS TO NEAR ZERO DURING BACKWASH OPERATION; BACKWASH PUMP LAMP IS ON.		
Step 1.	Check for closed or clogged valve on tank.	<ul style="list-style-type: none"> a. Open closed valve by turning handle fully to the left until it stops (counter-clockwise). b. Clean clogged valve.
Step 2.	Check for clogged strainer or BACKWASH PUMP suction opening (para. 3-6).	<ul style="list-style-type: none"> a. Flush strainer with product water to remove debris. b. Remove debris from suction opening.
Step 3.	Check level of water in backwash water tank.	NOTE
<p>On ROWPU's having mechanical backwash timers (Model No 600-1) there is a period of about 2 minutes during the backwash cycle when the backwash flow gage reads "0" while the backwash pump is on; this is a normal part of the cycle.</p> <p>In units having the solid-state timer (Model 600-3), there is a period of about 15 seconds when the flow gage will drop to "0" before returning to a normal reading. This is normal.</p> <p>If water level is below backwash pump intake, immediately shut off backwash pump. Patch any leaks in backwash water tank (para. 3-8). Fill tank with raw water and continue backwash operation.</p>		
Step 4.	Check for leaking hose.	Replace defective hose.
9. DISTRIBUTION NOZZLE DELIVERS LITTLE OR NO PRODUCT WATER; DISTRIBUTION PUMP LAMP IS ON.		
Step 1.	Check for water level below distribution pump intake in product water tank.	<ul style="list-style-type: none"> a. Patch any leaks in product water tanks. b. Continue operations to produce product water.

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION

TEST OR INSPECTION

CORRECTIVE ACTION

Step 2. Check for loose hose connections or leaking hose.

a. Tighten loose connections.

b. Replace leaking hose.

Step 3. Check distribution nozzle for broken parts or inoperative handle.

Replace defective distribution nozzle.

10. PUMP LAMP ON CONTROL BOX ASSEMBLY DOES NOT LIGHT WHEN SWITCH IS SET TO START.

NOTE

Step 1 applies only to normal start of the raw water pump. If other pump lamps do not light when started in proper order, go to step 2.

Step 1. Ensure the EMERGENCY STOP button is pulled out.

Pull EMERGENCY STOP button out.

Step 2. Check to see if ROWPU is receiving power from power source. R.O. pump LOW PRESSURE LAMP should be on and panel light should work if ROWPU is receiving power.

a. Make sure power source is securely plugged into junction box.

b. Troubleshoot power source using applicable manual.

Step 3. Check to see if associated pump is operating. For R.O. pump, see if sheave is turning; for other pumps, rest a hand lightly on the motor casing to feel for motor vibrations, check for correct pump rotation.

a. If motor is running, replace panel light bulb (para. 3-10).

NOTE

If new bulb does not light, notify unit maintenance to troubleshoot lamp socket and wiring.

b. If motor is not running, go to step 4.

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION	TEST OR INSPECTION	CORRECTIVE ACTION
-------------	--------------------	-------------------

WARNING

Electric shock can cause severe injury or death. Do not touch anything in the junction box except the circuit breaker handle.

Step 4. Check circuit breakers.

- Reset circuit breaker.
- Attempt to start pump.
- If pump will not start, notify unit maintenance.

11. R.O. PUMP SHUTS DOWN BY ITSELF; R.O. PUMP LOW PRESSURE LAMP COMES ON.

- Step 1. Check to see if booster pump is operating. Rest hand lightly on motor casing to feel for vibrations.
 - If pump is not operating, reset circuit breaker if necessary and try to restart pump. If pump will not start, notify unit maintenance.
 - If booster pump is operating, check for clockwise rotation (from fan end).
- Step 2. Check to see if cartridge filter gage reads over 20 psid.

If over 20 psid, change filter tube elements (para. 3-5).
- Step 3. Check RAW WATER gage for normal flow.
 - If low flow exists, move raw water pump closer to source.

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION

TEST OR INSPECTION

CORRECTIVE ACTION

b. If raw water flow is normal, go to step 4.

Step 4. Check to see if MULTIMEDIA FILTER gage has risen 5 psid over reading at startup.

a. If yes, backwash multimedia filter (para. 2-26).

b. If no, go to step 5.

Step 5. Make turbidity test of water taken from DRAIN NO. 1 CARTRIDGE FILTER valve (fig. 2-36).

a. If water is turbid, shut down ROWPU in normal manner (para. 2-31) and change cartridge filter elements (para. 3-5).

b. If water is clear, notify unit maintenance.

12. R.O. PUMP SHUTS DOWN AUTOMATICALLY; R.O. PUMP HIGH PRESSURE LAMP GOES ON.

CAUTION

If HIGH PRESSURE RELIEF VALVE did not activate before R.O. PUMP HIGH PRESSURE switch, notify unit maintenance.

Step 1. Check to see if R.O. PRESSURE PSI gage is over 1150 psi.

a. Clean R.O. elements (para. 2-29) then attempt to restart R.O. pump.

b. If R.O. PUMP RESET switch does not turn off R.O. PUMP HIGH PRESSURE lamp, there may be a defective switch. Notify unit maintenance.

13. BACKWASH PUMP DOES NOT START WITHIN 5 MINUTES FROM THE TIME THE START BACKWASH SWITCH IS SET TO START (MECHANICAL TIMER - MODEL NO. 600-1).

Step 1. Check that the timer recharge knob is in the idle position (fig. 2-71).

Rotate clockwise to the idle position as required.

Step 2. Push START BACKWASH switch (33, fig. 2-4) up to START position. Inspect timer recharge lever to see if the lever has been pulled to the right to rotate the recharge knob (fig. 2-71).

Manually push lever to the right as required.

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION

TEST OR INSPECTION

CORRECTIVE ACTION

NOTE

If the timer still fails to operate but there is electrical power to the timer box, you can manually backwash the filter.

Step 3. Manually backwash filter as follows:

- a. With a small screwdriver or similar tool, press against the raised button on the white cam to rotate the cam counterclockwise to the BW (backwash) position (fig. 2-72).

NOTE

The backwash pump should start. Allow to backwash for 5 minutes.

- b. Rotate white cam to rinse position.

NOTE

Allow filter to rinse for 5 minutes.

- c. Rotate white cam to the SR (service) position. Backwash is now complete.
- d. Report defective timer to unit maintenance for replacement.

14. BACKWASH PUMP DOES NOT START WHEN START BACKWASH SWITCH IS SET TO START (SOLID- STATE TIMER - MODEL 600-3)

Step 1. Check that INTERNAL INDICATOR knob is in SERVICE position (view 1, fig. 2-74).

Press RESET button to ensure knob is in SERVICE position.

NOTE

If backwash pump still does not start, filter can be manually backwashes.

Step 2. Manually backwash multimedia filter as follows:

- a. Turn INTERNAL INDICATOR knob counterclockwise to BACKWASH position. Backwash should start.

NOTE

Allow filter to backwash for 10 minutes.

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION	TEST OR INSPECTION	CORRECTIVE ACTION
-------------	--------------------	-------------------

- b. After 10 minutes of backwashing, turn knob counterclockwise to C/R (conditioned rinse) position.

NOTE

Allow filter to rinse for 2 minutes.

- c. After 2 minutes of conditioned rinse, turn knob counterclockwise to SERVICE position. Backwash is now complete.
- d. Report defective timer to unit maintenance.

15. MULTIMEDIA FILTER VENT LINE DOESN'T DISCHARGE WATER.

- Step 1. Check vent line for obstruction.

Remove obstructions from vent line.

16. CHEMICAL FEED PUMP FAILS TO PRIME.

- Step 1. If pump fails to prime after setting control knob to max. (Model No. 600-1 should read 10; Model No. 600-3 should read 8.5). Check the plastic suction line from the container to the pump.

- a. If water level in suction tube does not reach the pump body or the water is not passing through the suction or discharge ball valves, disconnect the suction and discharge tubes from the valves.
- b. (Model No. 600-1) Remove nuts and studs from pump head. Noting proper assembly of valve parts, disassemble and look for any foreign matter such as tape, dirt, etc. which blocks water passage. Remove foreign matter.
- c. (Model No. 600-3) Unscrew tubing nut from pump head. Remove four hex-head capscrews from diaphragm body. Inspect for and remove any foreign material between ball and valve seat.
- d. Assemble valve parts and reconnect suction and discharge tubes.

17. PRODUCT WATER TOTAL DISSOLVED SOLIDS (TDS) LEVEL IS ABOVE 1500 PPM.

- Step 1. Check product water from each pressure vessel as follows:

- a. Startup ROWPU as normal (para. 2-25).

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION

TEST OR INSPECTION

CORRECTIVE ACTION

- b. Adjust R.O. PRESSURE to 960 psig for seawater feed or 500 psig for fresh/brackish water feed. Collect a sample of product water in a clean container and measure TDS with TDS meter (para. 2-32). Record value.
- c. Open REGULATE PRODUCT WATER valve fully. Product water flow should decrease to zero.
- d. If sample valves are available (Model No. 600-3), use them to collect sample product water from each vessel. If sample valves are not available (Model No. 600-1), use the following procedures:

WARNING

Take care when removing hoses from product water manifold. Water is under pressure and will discharge rapidly.

- (1) Remove R.O. VESSEL 1 (top vessel) product water hose from product water manifold (vertical pipe with VENT PRODUCT WATER valve at top) by disconnecting camlock fitting.
 - (2) Install male plug camlock fitting in product water manifold in place of R.O. Vessel 1 hose camlock fitting.
 - (3) Remove threaded plug from end of product water stub tube at Vessel 1 front end cap (vessel end nearest drain valves).
 - (4) Slowly close REGULATE PRODUCT WATER valve until R.O. PRESSURE gage reads 800 (or 500 or brackish water) psig. Product water should flow from both ends of Vessel 1.
- e. Using clean containers, collect a sample of product water from each end of R.O. Vessel 1. Be sure to rinse each container twice with sample water before collecting sample. Mark container appropriately as front or rear.
 - f. Open REGULATE PRODUCT WATER valve fully. Product water flow should decrease to zero at product water flow meter and Vessel 1 stub tubes.
 - g. Measure TDS of each product water sample using the TDS meter (para. 2-32).
 - h. Based on the TDS measurements of the collected samples, one of the following four conditions can exist:

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION
TEST OR INSPECTION
CORRECTIVE ACTION

CONDITION	MEASURED TDS		CAUSE
	FRONT SAMPLE	REAR SAMPLE	
1	Normal	Normal	Vessel Operation OK
2	High	Normal	Leak At Front End-Connector O-Rings*
3	Normal	High	Leak At Rear End-Connector O-Rings*
4	High	High	Leak At Front And Rear End-Connector O-Rings and/or Element Interconnector O-Rings* • Condition could also be caused by defective R.O. element

- Condition 1: Replace threaded plug in product water stub tube end, remove male plug camlock fitting, and reinstall product water hose into product water manifold. Repeat steps d through j for all remaining vessels to determine the correct source(s) of high TDS.
- Condition 2: Remove front end cap and end-connector and check condition, lubrication, and size of O-rings. Replace damaged or wrong-size O-ring(s), lubricating O-rings with lubricant found in Storage Box No. 2 before installation. **Carefully** reinstall end-connector and end cap per para. 3-4h.
- Condition 3: Remove rear end cap and end-connector and check condition, lubrication, and size of O-rings. Replace damaged or wrong-size O-ring(s), lubricating O-rings with lubricant found in Storage Box No. 2 before installation. **Carefully** reinstall end-connector and end cap per para. 3-4h.
- Condition 4: Remove the R.O. elements from the pressure vessel per para. 3-4. Check condition, lubrication, and size of all O-rings. Replace damaged or wrong-size O-ring(s), lubricating O-rings with lubricant found in Storage Box No. 2 before installation. **Carefully** install elements and end caps per para. 3-4h.
- i. Adjust R.O. PRESSURE to 800 psig (seawater) or 500 psig (brackish water).
 - j. For each R.O. vessel in which O-rings were inspected, collect a sample of product water from each end of vessel, rinsing each container twice with sample water before collecting sample. Do one vessel at a time. Mark container appropriately as front or rear.
 - k. Open REGULATOR PRODUCT WATER valve fully.

Table 3-2. Troubleshooting (ROWPU) (continued)

MALFUNCTION	TEST OR INSPECTION	CORRECTIVE ACTION
		<ul style="list-style-type: none">l. Measure TDS of each product water sample (para. 2-30c(5)). If one or both samples are still high, leaky O-rings or faulty (cracked) connectors may still be present, or one or both R.O. elements maybe faulty. Depending upon availability of time, either repeat steps a through l or replace the elements (para. 3-4).m. When all vessels are producing normal TDS product water, reinstall all product water hoses and threaded plugs.n. Resume normal operation.
	Step 2. R.O. elements maybe scaled or fouled.	Clean R.O. elements (para. 2-28).

Section III. MAINTENANCE PROCEDURES

3-3. INTRODUCTION. This section provides maintenance procedures to be performed by the operator.

3-4. CHANGING R.O. ELEMENTS.

a. General. The R.O. elements are replaced anytime TDS of product water exceeds 1500 parts per million and cannot be corrected by using procedures described in item 17, Table 3-2, Troubleshooting. Each R.O. vessel contains two R.O. elements.

CAUTION

If removing end caps from more than one R.O. vessel, mark end caps with pencil or chalk to ensure they are replaced on correct vessel and correct side.

Shutdown ROWPU and relieve all pressure before removing the R.O. element, or loosening any parts of the R.O. pressure vessels.

NOTE

Some steps require two people.

b. Pre-removal Procedures.

- (1) Shut the ROWPU down normally (para. 2-31).
- (2) Open all R.O. vents, drains, and valves (fig. 2-36 and 2-37).
- (3) Remove strainer and hose from water source.

CAUTION

To reduce chances of leaks, mark end caps and vessel (alignment marks) with chalk or pencil so that end caps are installed in the same position.

LEGEND:

- 1. Hose Clamp
- 2. Hose
- 3. Nut
- 4. Bolt
- 5. Clamp
- 6. Bushing
- 7. Elbow
- 8. Nut
- 9. Washer
- 10. End Cap
- 11. Puller Bolts
- 12. Pressure Tube

Figure 3-1. R.O. Vessel End Cap Assembly Removal

c. End Cap Assembly (Refer to fig. 3-1).

- (1) Loosen hose clamp (1) and remove tubing (2) from end cap (10).
- (2) Remove nut (3), bolt (4), clamp (5), and bushing (6) from elbow (7).
- (3) Swing elbow (7) away from end cap (10).
- (4) Remove nuts (8) and washers (9) from end cap (10).

CAUTION

Use extreme caution when separating end cap from vessel. Vessel studs and seal are easily damaged.

(5) Gently and carefully insert flat-tip screwdriver between vessel and end cap. Slowly separate end cap from vessel.

- (6) Repeat steps (1) through (5) for opposite end cap.

d. Element Puller Assembly (Refer to fig. 3-2).

- (1) Assemble element puller by screwing together the puller rod (1) and puller rod handle (2).

LEGEND:

1. Puller Rod
2. Puller Rod Handle

Figure 3-2. R.O. Vessel Element Puller

LEGEND:

|-------------------------------|-------------------------|
| 1. Element Puller (Assembled) | 5. Interconnector |
| 2. R.O. Vessel | 6. Element Puller Plate |
| 3. End Connector | 7. Flat Washer |
| 4. R.O. Elements | 8. Nut |

Figure 3-3. R.O. Vessel Element Puller Assembly

CAUTION

If possible, remove elements in direction of flow. Because of obstruction by generator, elements for Army Model 600-1 must be removed and installed from trailer hitch end.

MC Model 600-3 users should remove elements from chemical feed pump end and install from R.O. pump end.

(2) Refer now to fig. 3-3. From the front of the ROWPU, insert element puller (1) into R.O. vessel (2). Push puller through end connector (3), through the product water tubes of the two R.O. elements (4), and through the interconnector (5) between the two R.O. elements.

(3) Place element puller plate (6) on assembled element puller (1) and secure with flat washer (7) and nut (8).

(4) After inserting the element puller into the R.O. elements and attaching the element puller plate, the assembly will be as shown below.

e. Removal. (Refer to fig. 3-4)

(1) Slowly pull both R.O. elements (1) from R.O. vessel (2), while someone else supports assembly. Be careful to keep element puller centered in tube.

NOTE

Placing one hand on frame while pulling with the other hand may help to keep the element puller centered.

LEGEND:

- | | |
|-------------------------|-------------------|
| 1. R.O. Elements | 4. Element Puller |
| 2. R.O. Vessel | 5. Interconnector |
| 3. Element Puller Plate | 6. End Connector |

Figure 3-4. Pulling Element From R.O. Vessel

(2) Disconnect the element puller plate (3) after both R.O. elements are removed. Pull element puller out of R.O. elements and end connectors. With one person on either end of assembly, twist and pull elements apart.

f. Inspection.

- (1) Inspect inside R.O. vessels for nicks and gouges.
- (2) Check interconnector and both end connectors for deep scratches and cracks.
- (3) Check brine seals and O-rings for cracks and tears.

g. Cleaning.

- (1) Flush dirt from inside R.O. vessels using brine water.
- (2) Wipe any dirt from interconnector or end connectors using a clean cloth.

h. Installation. (Refer to fig. 3-5).

- (1) Lubricate O-rings with O-ring lubricant from Storage Box No. 2.

NOTE

There is a smaller and a bigger sized O-ring on the end connectors. The side of the end connector which will fit on end of R.O. element has a lip on the inside. This side of end connector has the bigger O-ring. The interconnector O-rings are the same size as the bigger end connector O-rings.

- (2) Install O-rings (1) and (3) in end connectors (2) and interconnector (5).

LEGEND:

- | | |
|--|-----------------------------------|
| 1. End Connect O-ring (1.680 In. O.D.) | 6. End Cap O-ring (6.00 In. O.D.) |
| 2. End Connector | 7. End Cap |

| 5. Membrane Interconnector | 10. R.O. Vessel |
| | 11. Brine Seals |

Figure 3-5. R.O. Vessel (Exploded View)

WARNING

Some R.O. elements are packaged in sealed plastic bags with the protective chemical formaldehyde, which is poisonous; avoid fumes and keep away from eyes and mouth. Handle with extreme care. After handling, wash hands thoroughly with soap and water.

CAUTION

After removing R.O. element from sealed plastic bag, take care to keep element clean. Failure to do so will bring dust and dirt into R.O. elements and cause early element failure.

(3) Remove new R.O. element (4) from sealed plastic bag.

(4) Refer now to fig. 3-6, and install brine seal (1) in groove of R.O. element (2) making sure open end faces R.O. pump end of ROWPU.

(5) Insert by hand the first R.O. element (2) into R.O. vessel (3) until brine seal (1) touches end of R.O. vessel.

LEGEND:

- 1. Brine Seal
- 2. R.O. Element
- 3. R.O. Vessel

NOTE

(MC) Direction of flow is indicated on the side of each element.

Figure 3-6. Element Replacement

(6) Refer now to fig. 3-7. Place interconnector (1) on product water tube (2) of first R.O. element (3).

NOTE

Do not confuse interconnector with end connectors. End connectors have a lip on the outside.

LEGEND:

- 1. Interconnector
- 2. Product Water Tube
- 3. R.O. Element

Figure 3-7. Element Replacement

(7) Remove second R.O. element from sealed plastic bag.

(8) Install brine seal (1) into groove of second R.O. element. Make sure that the open end of the seal is opposite the direction of flow.

(9) Refer now to fig. 3-8. Insert product water tube (2) of the second R.O. element into interconnector (3).

LEGEND:

- 1. Brine Seal
- 2. Product Water Tube
- 3. Interconnector

Figure 3-8. Element Replacement

(10) Refer now to fig. 3-9. Slide both R.O. elements (1) and interconnector (2) into R.O. vessel (3) until they are centered in the vessel.

(11) Place end connectors (4) on both ends of product water tubes of R.O. elements. Join them to product water tubes of end caps.

(12) Align end caps with matchmark on R.O. vessel.

(13) Press end caps onto studs.

Figure 3-9. Element Replacement

(14) Place 10 washers and nuts onto studs.

CAUTION

65 in. lb (5.4 ft. lb) is maximum torque for end cap nuts. Do not exceed this torque.

(15) Slowly and evenly tighten nuts until handtight (snug). Never turn one nut more than two turns at a time. Once handtightened, evenly tighten each nut 1/8 turn with wrench.

(16) Reconnect pipes to R.O. vessel (fig. 3-1).

(a) Put hose clamp (1) over tubing (2). Place tubing (2) and clamp (1) over adapter (13) and tighten clamp (1).

(b) Place bushing (6) back on pipe.

(c) Swing elbow (7) back into place and put onto bushing (6) over elbow (7).

(d) Put clamp (5) over bushing (6).

(e) Put bolts (4) into clamps (5).

(f) Put nuts (3) on bolts (4) and tighten.

(17) Operate ROWPU (para. 2-24) and observe for leaks.

3-5. CHANGING CARTRIDGE FILTER TUBE ELEMENTS. (Model No. 600-1, refer to fig. 3-10. Model No. 600-3, refer to fig. 3-11.)

a. Description. The cartridge filter contains eight filter tube elements. Cartridge filter tube elements should be changed when CARTRIDGE FILTER gage differential pressure rises above 20 psid.

LEGEND:

1. Eye Nuts
2. Washers
3. Cover Brackets
4. Cover
5. O-ring
6. Vent Hose
7. Clamp Hook Assy.
8. Upper Seat Plate
9. Clamp Hook
10. Lower Seat Plate
11. Filter Tube
12. Bolts

Figure 3-10. Cartridge Filter Assembly (Model No. 600-1)

b. Removal (Model No. 600-1).

- (1) Shut down ROWPU in the normal manner (see para. 2-31).
- (2) Open VENT CARTRIDGE FILTER VALVE (fig. 2-56).
- (3) Open DRAIN NO. 1 CARTRIDGE FILTER valve fully (see para. 2-12 and fig. 2-8).
- (4) Loosen three eye nuts (1) and slide eye nuts and washers (2) from the three cover brackets (3).
- (5) Use quick disconnect and remove tubing from vent (6).
- (6) Lift cover (4) and remove cover seal O-ring (5) from filter. Be careful not to damage cover seal O-ring (5) and vent hose (6).

NOTE

Check O-ring for cracks, breaks, and hardening. Replace O-ring if defective.

(7) Grasp handle of filter seat and clamp hook assembly(7) and pull up until it catches and stays open. Extend clamp hook to handle length (by about 1 inch) and lock in extended position.

(8) Let assembly fall to resting (original) position.

NOTE

Arrow stamped on upper seat plate (8), near handle, shows direction of filter seat and clamp hook (9).

(9) Tilt assembly until hook is free from lower seat plate (10).

(10) Remove and discard used filter tube (11).

c. Installation (Model No. 600-1).

(1) Place new filter tube (11) on assembly and rotate slightly to assure seating on upper seat plate (8).

(2) Insert assembly into filter shell with hook and tube in hole of lower seat plate (10).

(3) Engage hook on underside of lower seat plate (10).

(4) Grasp handle of filter seat and clamp hook assembly(7) and pull up until it uncocks, allowing holding spring to retract.

(5) Rotate assembly slightly to assure seating.

(6) Allow handle to go down so filter tube seat is on plate.

NOTE

Upper seat plate on the filter seat and clamp hook assembly should be centered on the tube thereby covering all of the center hole of the tube.

(7) With one hand on the handle of the filter seat and clamp hook assembly (7), and the other hand on the filter tube (11), attempt to remove each assembly without tipping handle to one side and unhooking (as shown in fig. 3-10).

NOTE

If filter tube and seat and clamp assembly can be removed without tipping handle to one side and unhooking, the installation is incorrect. Pull hook from handle to catching position and reinstall filter element.

(8) Make sure that cover seal O-ring (5) is correctly in place.

(9) Carefully replace cover (4) on cartridge filter. Avoid damage to O-ring (5) and plastic vent tube (6).

(10) Swing the three eye nuts, washers and bolts up through the ears on cover brackets (3) and tighten eye nuts (1) evenly until cover is fully down. Do not overtighten.

(11) Connect quick disconnect to vent (6).

(12) Operate ROWPU in normal manner (para. 2-25) and inspect cartridge filter for leaks. If there are leaks, shut down ROWPU (para. 2-31) and tighten cover nuts or replace O-ring as applicable.

d. Removal (Model No. 600-3).

(1) Shut down ROWPU in the normal manner (see para. 2-31).

(2) Open VENT CARTRIDGE FILTER valve (fig. 2-56).

(3) Open DRAIN NO. 1 CARTRIDGE FILTER valve fully (para. 2-12).

(4) Loosen six eyenuts (1) and washers (2) from the cover brackets (3).

(5) Use quick disconnect and remove tubing from vent (6).

(6) Lift cover (4), remove O-ring (5) and hose on vent (6). Check O-ring for cracks, breaks and hardening. Replace O-ring if bad.

LEGEND:

1. Eyenut
2. Washer
3. Bracket
4. Filter Cover
5. O-ring
6. Vent
7. Compression Plate
8. Tube Guides
9. Filter Tube
10. Sump Seat

Figure 3-11. Cartridge Filter Tube (Model No. 600-3)

(7) Remove compression plate (7) with tube guides (8).

- (8) Remove the eight filter tubes (9) and discard.
- e. Installation (Model No. 600-3).
 - (1) Install eight new filter tubes (9) making sure that the tubes seat is in the guides on the sump seat (10).
 - (2) Replace compression plate (7) making sure that the tube guides (8) seat in the filter tubes (9).
 - (3) Replace O-ring (5) and filter cover (4).

CAUTION

Ensure all filter tubes are properly seated before tightening eyenuts.

- (4) Slide eyenuts (1) with washers (2) into cover brackets (3) and tighten in the order shown (fig. 3-12).
- (5) Attach quick disconnect to vent (6).
- (6) Operate ROWPU in normal manner (para 2-25) and check for leaks.

Figure 3-12. Cartridge Filter End Plate (Nut Tightening Sequence)

3-6. BACKWASH PUMP STRAINER (refer to fig. 3-13).

- a. Removal.
 - (1) Shut down ROWPU in normal manner (para. 2-31).
 - (2) Loosen T-handle screw assembly (1) by turning to the left to release pressure on the strainer cap (4).
 - (3) Loosen the two bolts (2) and swing the yoke (3) and the T-handle out of the way as shown.
 - (4) Using the two ears on the strainer cap (4), twist back and forth until it loosens and lifts off the strainer housing (8).
 - (5) Remove the gasket (5) and discard if it is damaged or unserviceable.
 - (6) Lift handle on strainer screen (6) and remove screen from the strainer housing (8).

(7) Remove drain plug (7) from the bottom of strainer housing.

b. Cleaning.

(1) Flush strainer housing (8) with product water to remove foreign matter and dirt.

(2) Flush strainer screen (6) with product water. Make sure that all the holes in the screen are open.

(3) Clean strainer screen.

LEGEND:

- 1 T-Handle
- 2 Bolts
- 3 Yoke
- 4 Strainer Cap
- 5 Gasket
- 6 Strainer Screen
- 7 Drain Plug
- 8 Strainer Housing

Figure 3-13. Backwash Pump Strainer

(4) Remove dirt or corrosion from cap (4) and strainer housing (8).

c. Installation.

(1) Install drain plug (7) in bottom of strainer housing (8).

(2) Install the strainer screen (6).

- (3) Install the gasket (5) and strainer cap (4) on top of the strainer housing.
- (4) Swing yoke (3) and T-handle screw assembly (1) back into position under the bolts (2).
- (5) Recenter the strainer cap (4) making sure the gasket is positioned correctly.
- (6) Tighten both bolts.
- (7) Tighten T-handle (1).

3-7. RUPTURE DISC.

CAUTION

Continued operation after the rupture disc opens could damage the ROWPU. Immediately shut off the ROWPU with the EMERGENCY STOP button (fig. 2-48) and open the REGULATE PRODUCT FLOW valve (3, fig. 2-64) all the way.

a. General. The rupture disc is a safety device for the R.O. Pump Assembly. If the pressure ever reaches 1425 psi on the R.O. PRESSURE PSI gage, the rupture disc tears open relieving the pressure. The disc is mounted in a screw-type mount body on top of the R.O. pump discharge pipe. Replace the rupture disc after it blows, and before starting the ROWPU again.

b. Removal.

- (1) Remove holddown screw (1) from body (4).
- (2) Remove holddown ring (2).
- (3) Remove ruptured disc (3) and discard.

Figure 3-14. R.O. Pump Rupture Disc and Holder

c. Installation.

- (1) Place the side of new rupture disc (3) that curves upward toward the top.
- (2) Insert it into body (4).
- (3) Replace holddown ring (2).

CAUTION

To avoid damaging rupture disc, do NOT overtighten holddown screw.

- (4) Reinsert holddown screw (1). Tighten until hand tight (snug), then tighten 1/8 turn with wrench.

3-8. REPAIR OF CANVAS PRODUCT WATER AND BRINE WATER TANKS.

a. General. Canvas tanks with rubber backing are used to store product water and brine water. Sometimes these tanks may be cut or punctured. Tanks then leak and must be repaired.

CAUTION

To avoid possible damage, the site should be free from stones or sharp sticks, be fairly smooth, and covered with the ground cloth before the tank is placed on ground.

b. Repair. If a tank is punctured, use the oval sealing clamps supplied in the repair kit to make temporary repairs.

NOTE

The tank does not need to be drained to make these repairs.

(1) Determine the size of sealing clamp needed. If the hole or slit is up to 2 1/2 inches (6.35 cm) in length, use the 3-inch (7.62 cm) sealing clamp. If the hole or slit is 2 1/2 to 4 inches (6.35 cm to 10.16 cm) in length, use the 5-inch (12.7 cm) sealing clamp.

(2) If necessary, carefully enlarge the slit to slip the narrow side of the inside clamp through.

(3) Slip the inside clamp through the slit in the tank and rotate it to line up with the slit.

(4) Rotate the outside clamp to lineup with the inside clamp.

(5) Center both clamps over the slit, pull them together with the rope, and tighten the wing nut as tight as possible with your fingers.

3-9. CALIBRATION AND REPAIR OF PORTABLE TDS METER.

CAUTION

The TDS meter is an accurate meter. With the exception of calibrating meter or replacing meter battery, never attempt to service or modify instrument, nor allow it to get wet since moisture will damage the meter.

a. Calibration. Perform a calibration check in accordance with para. 2-32c(4) each time before using TDS meter. Whenever switching to or from seawater sources, meter must be recalibrated in accordance with para. 2-32c(2) or para. 2-32c(3).

b. Battery Replacement (fig. 3-15):

(1) Remove bottom plate.

(2) Disconnect leads from battery.

(3) Install new battery and connect leads.

(4) Install bottom plate.

(5) Check calibration in accordance with para 2-32c.

Figure 3-15. Total Dissolved Solids (TDS) Meter (Portable) Battery Replacement

3-10. REPLACE SWITCH INDICATOR LAMPS (refer to fig. 3-16).

a. Removal.

- (1) Unscrew lens cap (1).
- (2) Twist bulb (2) to left and push in at the same time using lamp puller in Storage Box No. 2.

CAUTION

Be careful not to lose the cupped gasket washer. Without this gasket, you can break lens when tightening, and dampness will fog lens.

LEGEND

- 1. Lens Cap
- 2. Lamp Bulb
- 3. Gasket Washer
- 4. Lamp Base Holder

Figure 3-16. Switch Indicator Lamp Replacement

b. Installation.

- (1) Replace bulb (2) with lamp puller in Storage Box No. 2.
- (2) Cover the lamp base holder (4) with gasket washer (3).

NOTE

Clean lens cap (1) before reassembly.

- (3) Screw on lens cap (1).

3-11. REPLACING LAMP IN THE PANEL LIGHT (refer to fig. 3-17).

a. Removal.

- (1) Using flat-tip screwdriver, loosen setscrew (1), observing position of shield.
- (2) With your fingers, unscrew guard (2), lens (3), and bulb (4) from lamp base (5).

NOTE

Lens must be cleaned before installation.

b. Installation.

- (1) With your fingers, screw bulb (4), lens (3), and guard (2) into lamp base (5).
- (2) Position shield in same position it was in before you removed it.

(3) Using flat-tip screwdriver, tighten setscrew (1) to secure guard.

CHAPTER 4

MAINTENANCE OF AUXILIARY EQUIPMENT

4-1. POWER SOURCE. (ARMY). Maintenance of Army generator set is covered in TM 5-6115-465-12 for NSN 6115-00-118-1240.

(MC) Marine Corps users will refer to applicable publications referencing power sources used by that organization.

APPENDIX B

COMPONENTS OF END ITEM AND BASIC ISSUE ITEMS LISTS

Section I. INTRODUCTION

B-1. SCOPE

This appendix lists components of end item and basic issue items for the ROWPU to help you inventory items required for safe and efficient operation.

B-2. GENERAL

The Components of End Item and Basic Issue Items Lists are divided into the following sections:

a. Section II. Components of End Item This listing is for informational purposes only, and is not authority to requisition replacements. These items are part of the end item, but are removed and separately packaged for transportation or shipment. As part of the end item, these items must be with the end item whenever it is issued or transferred between property accounts. Illustrations are furnished to assist in identifying items.

b. Section III. Basic Issue Items These are the minimum essential items required to place the ROWPU in operation, to operate it, and to perform emergency repairs. Although shipped separately packaged, BII must be with the shelter during operation and whenever it is transferred between property accounts. The illustrations will assist you with hard-to-identify items. This manual is your authority to request/requisition replacement BII, based on TOE/MTOE authorization of the end item.

B-3. EXPLANATION OF COLUMNS

The following provides an explanation of columns found in the tabular listings:

a. Column (1) - Illustration Number (Illus No.). This column indicates the number of the illustration in which the item is shown.

b. Column (2) - National Stock Number. Indicates the National stock number assigned to the item and will be used for requisitioning purposes.

c. Column (3) - Description Indicates the Federal item name and, if required, a minimum description to identify and locate the item. The last line for each item indicates the CAGEC (in parentheses) followed by the part number.

d. Column (4) - Unit of Measure (U/M). Indicates the measure used in performing the actual operational/maintenance function. This measure is expressed by a two-character alphabetical abbreviation (e.g., ea, in, pr).

e. Column (5) - Quantity required (Qty Rqd). Indicates the quantity of the item authorized to be used with/on the equipment.

APPENDIX C
ADDITIONAL AUTHORIZATION LIST
NOT APPLICABLE

APPENDIX D

EXPENDABLE/DURABLE SUPPLIES AND MATERIALS LIST

Section I. INTRODUCTION

D-1. SCOPE. This appendix lists expendable/durable supplies and materials you will need to operate and maintain the Reverse Osmosis Water Purification Unit. This listing is for informational purposes only and is not authority to requisition the listed items. These items are authorized to you by CTA 50-970, Expendable/Durable Items (except Medical, Class V, Repair Parts, and Heraldic Items), or CTA 8-100, Army Medical Department Expendable/Durable Items.

D-2. EXPLANATION OF COLUMNS

a. Column (1) - Item Number. This number is assigned to the entry in the listing and is referenced in the narrative instructions to identify the material (e.g., Use cleaning compound, item 5, appendix C).

b. Column (2) - Level. This column identifies the lowest level of maintenance that requires the listed item.

- C - Operator/Crew
- O - Unit Maintenance
- F - Direct Support Maintenance
- H - General Support Maintenance

c. Column (3) - National Stock Number. This is the National Stock Number assigned to the item; use it to request or requisition the item.

d. Column (4) - Description. Indicates the Federal item name, and, if required, a description to identify the item. The last line for each item indicates the Commercial and Government Entity Code (CAGEC) in parentheses followed by the part number.

e. Column (5) - Unit of Measure (U/M). Indicates the measure used in performing the actual maintenance function. This measure is expressed by a two-character alphabetical abbreviation (e.g., EA, IN, PR). If the unit of measure differs from the unit of issue, requisition the lowest unit of issue that will satisfy your requirements.

Section II. EXPENDABLE/DURABLE SUPPLIES AND MATERIALS LIST

(1) Item Number	(2) Level	(3) National Stock Number	(4) Description	(5) U/M
1	F	8040-00-262-9005	Adhesive (81348) MMM-A-1617, Type II	TB
2	O		Anthracite, No. 2 (71726) 1610-16	EA

Section II. EXPENDABLE/DURABLE SUPPLIES AND MATERIALS LIST (continued)

(1) Item Number	(2) Level	(3) National Stock Number	(4) Description	(5) U/M
3	O	6810-00-242-4770	Calcium Hypochlorite, Technical: 3-3/4 lb Plastic bottle (81348) O-C114, Type I	EA
4	O	6810-01-044-0315	Chlorine Test Tablets: Palin, DPD Chlorine #1: 100 Per Box; (79172) U-2510	BPG
5	O	6810-01-164-3975	Citric Acid, Anhydrous, Technical: Crystalline; 3/4 Lb Plastic Bottle; (81 349) MIL-C-52947	EA

IN THIS SPACE TELL WHAT IS WRONG
AND WHAT SHOULD BE DONE ABOUT IT:

In line 6 of paragraph 2-1a the manual states the engine has 6 cylinders. The engine on my set only has 4 cylinders. Change the manual to show 4 cylinders.

Callout 16 on figure 4-3 is pointing at a bolt. In key to figure 4-3, item 16 is called a shim - Please correct one or the other.

I ordered a gasket, item 19 on figure B-16 by NSN 2910-00-762-3001. I got a gasket but it doesn't fit. Supply says I got what I ordered, so the NSN is wrong. Please give me a good NSN.

The Metric System and Equivalents

Linear Measure

1 centimeter = 10 millimeters = .39 inch
 1 decimeter = 10 centimeters = 3.94 inches
 1 meter = 10 decimeters = 39.37 inches
 1 dekameter = 10 meters = 32.8 feet
 1 hectometer = 10 dekameters = 328.08 feet
 1 kilometer = 10 hectometers = 3,280.8 feet

Weights

1 centigram = 10 milligrams = .15 grain
 1 decigram = 10 centigrams = 1.54 grains
 1 gram = 10 decigrams = .035 ounce
 1 dekagram = 10 grams = .35 ounce
 1 hectogram = 10 dekagrams = 3.52 ounces
 1 kilogram = 10 hectograms = 2.2 pounds
 1 quintal = 100 kilograms = 220.46 pounds
 1 metric ton = 10 quintals = 1.1 short tons

Liquid Measure

1 centiliter = 10 milliliters = .34 fl. ounce
 1 deciliter = 10 centiliters = 3.38 fl. ounces
 1 liter = 10 deciliters = 33.81 fl. ounces
 1 dekaliter = 10 liters = 2.64 gallons
 1 hectoliter = 10 dekaliters = 26.42 gallons
 1 kiloliter = 10 hectoliters = 264.18 gallons

Square Measure

1 sq. centimeter = 100 sq. millimeters = .155 sq. inch
 1 sq. decimeter = 100 sq. centimeters = 15.5 sq. inches
 1 sq. meter (centare) = 100 sq. decimeters = 10.76 sq. feet
 1 sq. dekameter (are) = 100 sq. meters = 1,076.4 sq. feet
 1 sq. hectometer (hectare) = 100 sq. dekameters = 2.47 acres
 1 sq. kilometer = 100 sq. hectometers = .386 sq. mile

Cubic Measure

1 cu. centimeter = 1000 cu. millimeters = .06 cu. inch
 1 cu. decimeter = 1000 cu. centimeters = 61.02 cu. inches
 1 cu. meter = 1000 cu. decimeters = 35.31 cu. feet

This fine document...

Was brought to you by me:

[Liberated Manuals -- free army and government manuals](#)

Why do I do it? I am tired of sleazy CD-ROM sellers, who take publicly available information, slap “watermarks” and other junk on it, and sell it. Those masters of search engine manipulation make sure that their sites that sell free information, come up first in search engines. They did not create it... They did not even scan it... Why should they get your money? Why are not letting you give those free manuals to your friends?

I am setting this document FREE. This document was made by the US Government and is NOT protected by Copyright. Feel free to share, republish, sell and so on.

I am not asking you for donations, fees or handouts. If you can, please provide a link to liberatedmanuals.com, so that free manuals come up first in search engines:
