# TM 11-6625-820-45 

DEPARTMENT OF THE ARMY TECHNICAL MANUAL

## GS AND DEPOT MAINTENANCE MANUAL TEST SET, RADIO AN/ARM-92

headquarters, DEPARTMENT OF THE ARMY SEPTEMBER 1966

## WARNING

Be careful when working on the 115 -volt, 400 -cps circuit. Serious injury or death may result from contact with this circuit.

## DON'T TAKE CHANCES!

## CAUTION

Do not make resistance measurements with power applied to the test set. Do not make resistance measurements that would place the ohmeter across a microampere meter in the test set.

HEADQUARTERS<br>DEPARTMENT OF THE ARMY W ashington, D. C., 21 January 1972

## General Support and Depot Maintenance Manual Including Repair Parts and Special Tool Lists TEST SETS, RADIO AN/ARM-92 AND AN/ARM-92A

TM 11-6625-820-45, 22 September 1966, is changed as follows:

## G5 and Depot Maintenance Manual <br> Including Repair Parts and Special Tools List <br> TEST SET, RADIO AN/ARM-92

TM 11-6625-820-45, 22 September 1966, is changed as follows:

1. The title of the manual is changed as shown above.
2. Remove old pages and insert new pages as indicated below.

| Remove pages | Insert pages |
| :--- | :--- |
| $1-1$ and $1-2$ | $1-1$ and $1-2$ |
| A-1 | A -1 |
|  | B-1 through B -38 |

3. File this change sheet in front of the publication for reference purposes.

By Order of the Secretary of the Army:

Official:
W. C. WESTMORELAND,
General, United States Army,
Chief of Staff.

KENNETH G. WICKHAM,
Major General, United States Army,
The Adjutant General.
Distribution:
To be distributed in accordance with DA Form 12-36 (Unclassified) requirements for Direct and General Support Maintenance Literature for the OV-1A, OV-1B, OV-1C, U-8F, U-10A, CH-47A, UH-1B, UH-1D and $\mathrm{OH}-6 \mathrm{~A}$ Aircrafts.
\& U.S. GOVERNMENT PRINTING OFFICE: 1968-344430/605

## CHAPTER 1

## FUNCTIONING

## Section I. GENERAL FUNCTIONING OF TEST SETS, RADIO AN/ARM-92 AND AN/ARM-92A

## 1-1. Scope

a. General. This manual contains general support and depot maintenance instructions for Test Sets, Radio AN/ARM-92 and AN/ ARM-92A. It includes instructions appropriate to these categories of maintenance for troubleshooting, testing, aligning, and repairing the equipment. The manual also lists tools, materials, and test equipment for maintenance. Detailed functions of the equipment are also covered.
b. Reporting of Equipment Manual Improvements. The direct reporting of errors, omissions, and recommendations for improving this equipment manual by the individual user is authorized and encouraged. DA Form 2028 (Recommended Changes to DA Publications) will be used for reporting these improvements. This form may be completed using pencil, pen, or typewriter and forwarded direct to Commanding General, U. S. Army Electronics Command, ATTN: AMSEL-MR-NMP-AD, Fort Monmouth, N, J. 07703.

Note: For other applicable forms and records, see paragraph - -3. TM 11-6625-820-12.
c. Index of Equipment Publication. Refer to the latest issue of DA Pam 310-4 to determine whether there are new editions, changes or additional publications pertaining to the equipment. DA Pam 310-4 is a current index of technical bulletins, supply bulletins, lubrication orders, and modification work orders available through publications channels. The index lists the individual parts ( $-10,-20,-35 \mathrm{P}$, etc) and the latest changes and revisions of each equipment publications.

## 1-2. Block Diagram Functioning of Test Set, Radio AN/ARM-92

a. General. Test Set Radio, AN/ARM-92 provides for the complete testing of Radio Receiving Set AN/ARN-82 (receiving set) when used with external test equipment. The test set can also be used to test a glide-slope receiver, and provides for flag and deviation loading. The glide-slope test requires a special cable that is not supplied with this unit. The functions of Test Set, Radio AN/ ARM-92 are:
(1) Power distribution.
(2) Phase shifting.
(3) Current measuring.
(4) Compass simulation.
(5) Self-test of control unit and functions of the test set.
b. Power Distribution Circuits. Control, Radio Set C-6873/ARM-82 (control unit), power relay K 1 , and power transformer T 1 comprise the power distribution circuits. The test set connects 27.5 volts direct current (dc) from an external power source to the control unit which applies or removes the 27.5 volts dc from the remaining power circuits. When the control unit applies this voltage to the remaining power circuits, 27.5 volts dc is applied to Radio Receiver R-1388/ARN-82 (radio receiver), or to the glide-slope receiver, and to power relay K1. The relay then energizes and connects 115 volts, 400 cycles per second (cps) to power transformer T1. Transformer T1 steps the voltage down to 26 volts, 400 cps , which is applied to the radio receiver. The control unit also supplies the tuning information required by the radio receiver, or the glide-slope receiver.

Figure 1-1. Test Set, Radio AN/ARM-92, block diagram.
c. Phase Shifting Circuits. The phase shifting circuits (comprised of precision bearing transformer T2; Indicator, Course ID-1347/ ARN-82, OBS (omni bearing switch) indicator; BEARING switch S3; and BRG-OBS switch S2) are used to shift the phase of the

30 -cycle refererence signal obtained from the radio receiver. Either the OBS resolver or precision bearing transformer T2 performs the phase shifting, and BRG-OBS switch S2 selects the one to be used. The OBS resolver shifts the phase of the 30 -cycle reference signal
anywhere from 0 to $360^{\circ}$, but precision bearing transformer T 2 shifts the phase of the signal in precise $30^{\circ}$ increments. The exact $30^{\circ}$ increment is selected by BEARING switch S3.
d. Current Measuring Circuits. TO-FROM meter M3 connects directly to the radio receiver and measures its to-from current. DEVIATION meter M1 and FLAG meter M2 are connected either to the radio receiver or to the glide-slope receiver, depending on the position of VOR/ LOC-GLIDE SLOPE switch S1. These two meters measure the deviation current and flag current from either receiver. The FLAG meter also measures the output of the RMI servoamplifier in the radio receiver. When SERVO AMP TEST pushbutton switch S 4 is pressed, it connects 27.5 volts dc to the RMI servoamplifier and to flag meter relay K2. The flag meter relay energizes and connects FLAG meter M2 to the RMI servoamplifier output of the radio receiver.
e. Compass Simulator Circuit. COMPASS SIMULATOR DS4 simulates a magnetic heading signal which is applied to the radio receiver. The simulated magnetic heading signal is also applied to Indicator, RMI ID-250A/ ARN on the test set to drive the RMI card.
f. Aid Box. The aid box checks the wiring harness in an aircraft installation of Radio Receiving Set AN/ARN-82, and checks the control unit installed in the test set or aircraft. It also provides a quick check of the accuracy of the meters in the test set. The aid box receives frequency information from the control unit in the test set or aircraft. This frequency information lights the lamps on the aid box in specific combinations. The aid box also receives 26 volts, 400 cps from the test set or from the aircraft. A portion of this voltage is rectified, and then divided to specific levels. Specific levels of dc voltage are applied to the meter circuits in the test set or to the aircraft indicators. A portion of the 26 volts, 400 cps is also used to check the audio wiring.

## 1-2.1. Block Diagram Functioning of Test Set, Radio AN/ARM-92A (fig 1-1.1)

a. General. Test Set Radio, AN/ARM-92A provides for the complete testing of Radio

Receiving Sets AN/ARN-82 and AN/ARN82 A (receiving set) when used with external test equipment. The test set can also be used to test a glide-slope receiver, and provides for flag and deviation loading. The glide-slope test requires a special cable that is not supplied with this unit. The functions of Test Set, Radio AN/ARM-92A are:
(1) Power distribution.
(2) Phase shifting.
(3) Resolver signal transmission.
(4) Current measuring.
(5) Compass simulation.
(6) Self-test of control unit and functions of the test set.
b. Power Distribution Circuits. Control, Radio Set C-6873/ARM-82 (control unit), power relay K1, and power transformer T1 comprise the power distribution circuits. The test set connects 27.5 volts direct current (dc) from an external power source to the control unit which applies or removes the 27.5 volts dc from the remaining power circuits. When the control unit applies this voltage to the remaining power circuits, 27.5 volts dc is applied to Radio Receiver R-1388/ ARN-82 (radio receiver), or to the glideslope receiver, and to power relay K1. The relay then energizes and connects 115 volts, 400 Hz to power transformer T1. Transformer T 1 steps the voltage down to 26 volts, 400 Hz , which is applied to the radio receiver. The control unit also supplies the tuning information required by the radio receiver, or the glide-slope receiver.
c. Phase Shifting Circuits. The phase shifting circuits (consists of precision bearing transformers T2 and T3; Indicator, Course ID-1347/ARN-82 (OBS); RECEIVER MODEL switch S5; BEARING switch S3; and BRG-OBS switch S2. These circuits are used to shift the phase of the $30-\mathrm{Hz}$ reference signal obtained from Radio Receiver R-1388/ARN-82. Either the OBS resolver or precision bearing transformer T2 performs the phase shifting; BRG-OBS switch S2 selects the one to be used. The OBS resolver shifts the phase of the $30-\mathrm{Hz}$ reference signal anywhere from 0 to $360^{\circ}$, precision bearing transformer T 2 shifts the phase of the signal in precise $30^{\circ}$ increments. The

Figure 1-1.1. Test Set, Radio AN/ARM-92A, block diagram.

## 1-2.2 Change 2

exact $30^{\circ}$ increment is selected by BEARING switch S3. RECEIVER MODEL switch S5 removes transformer T3 from the circuit and adjusts the remaining circuits for phase shifting.
d. Resolver Transmitter Circuit. The resolver transmitter circuit consists of precision bearing transformers T 2 and T 3 ; Indicator, Course ID-1347A/ARN-82 (OBS); RECEIVER MODEL switch S5; BEARING switch S3; and BRG-OBS switch S2. This circuit supplies $400-\mathrm{Hz}$ bearing information to Radio Receiver R-1388A/ARN-82. BRGOBS switch S2 selects either the OBS resolver or the simulated resolver comprised of transformers T2 and T3. RECEIVER MODEL switch S5 connects transformers T2 and T3 to form a simulated resolver and switches the input to $400-\mathrm{Hz}$ input. BEARING switch S3 selects the $30^{\circ}$ increment equivalent to the OBS resolver position.
e. Current Measuring Circuits. TO-FROM meter M3 connects directly to the radio receiver and measures its to-from current. DEVIATION meter M1 and FLAG meter M2 are connected either to the radio receiver or to the glide-slope receiver, depending on the position of VOR/LOC-GLIDE SLOPE switch S1. These two meters measure the deviation current and flag current from either receiver. The FLAG meter also measures the output of the RMI servoamplifier in the radio receiver. When SERVO

AMP TEST pushbutton switch S 4 is pressed, it connects 27.5 volts dc to the RMI servoamplifier and to flag meter relay K2. The flag meter relay energizes and connects FLAG meter M2 to the RMI servoamplifier output of the radio receiver.
f. Compass Simulator Circuit. COMPASS SIMULATOR DS4 simulates a magnetic heading signal that is applied to the radio receiver. The simulated magnetic heading signal is also applied to Indicator, RMI ID250A/ARN on the test set to drive the RMI card.
g. Aid Box. The aid box checks the wiring harness in an aircraft installation of Radio Receiving Set AN/ARN-82 or AN/ARN-82A and checks the control unit installed in the test set or aircraft. It also provides a quick check of the accuracy of the meters in the test set. The aid box receives frequency information from the control unit in the test set or aircraft. This frequency information lights the lamps on the aid box in specific combinations. The aid box also receives 26 volts, 400 Hz from the test set or from the aircraft. A portion of this voltage is rectified, and then divided to specific levels. Specific levels of dc voltage are applied to the meter circuits in the test set or to the aircraft indicators. A portion of the 26 volts, 400 Hz is also used to check the audio wiring.

## Section II. DETAILED CIRCUIT FUNTIONING

## 1-3. Power Distribution Circuits

The test set supplies all the necessary power connections for the operation of Radio Receivers R-1388/ARN-82 or R-1388A/ ARN-82 or a glide-slope receiver. The operation of these power circuits is described below. Refer to test set schematic diagram fig. 4-9 or 4-9.1) while reading the description in $a, b$, and $c$ below.
a. The external sources of power are connected to J 5 by Cable Assembly, Power, Electrical CX-11568/ARM-92 (power cable)
fig. 1-2). The 27.5 volts dc is applied between pins $A$ and $B$, the positive side to pin $A$, ground to pin B. The 115 volts, 400 cps is applied with the low side to pin C and the high side to pin D. The connection from pin $A$ of J 5 is made through fuse F 1 to pin Z of connector P5 of the control unit (fig. 4-9). When the control unit power switch is in the PWR or TEST position, the 27.5 -volt dc circuit is completed in pin M or H of P 5 . The 27.5 volts is then routed to TB1, tie point 18 . From tie point 18 , the voltage is routed to relay K1. This voltage energizes the relay K 1 , and the cir-

Figure 1-2. Cable Assembly, Power, Electrical CX-11568/ARM-92, schematic diagram.
cuits is completed for the 115 volts, 400 cps from pin D of J5 through fuse F3 to transformer T1. Transformer T1 steps down the 115 (volts, 400 cps to 26 volts, 400 cps . The 26 volts, 400 cps is routed to RMI connector P 4 , the compass simulator connector P 1 , and to connector P3 of the radio receiver. The RMI servoamplifier input is supplied with 26 volts, 400 cps from transformer T1 through resistors R6 and R7.
b. From tie point 18 of TB1, the 27.5 volts dc is routed to connector P 2 of the radio receiver, and also through fuse F2 to connector J 4 of the glide-slope receiver.
$c$. Tuning information from the control unit is routed to TB1, and branches off to both connectors P2 and J4, For further information on the control unit, refer to TM 11-5826-226-35 for Radio Receiving Set AN/ARN-82. A schematic diagram of the control unit is in figure 4-10.

## 1-4. Phase Shifting Circuits

fig. 4-9 and 4-9.1)
In the test set the two circuits that shift the phase of the 30 -cycle reference signal are the OBS resolver and precision bearing transformer T2. Their operation is described below. In Test Set, Radio TS-2500A/ARM92, RECEIVER MODEL switch S5 disables precision bearing transformer T3 and adjusts the circuit of transformer T2 whenever
the phase shifting mode is needed (switch position A).
a. BRG-OBS switch S2 determines which phase shifting circuit is used. When switch S2 is in the OBS position, the OBS resolver is used to produce the desired phase shift. The OBS indicator is the same type as used in an aircraft installation. The 30 -cycle reference signal is applied to the rotor of the resolver in the OBS indicator. When the rotor is turned, the phase of the signal at stator output is shifted. A compass card is attached to the rotor, providing an indication of the number of degrees of phase shift. This voltage is routed to the radio receiver. For more information on the OBS indicator, refer to TM 11-5826-226-35 for Radio Receiving Sets AN/ARN-82 and AN/ARN-82A. A schematic diagram of the OBS indicator is shown in figure 1-3.
$b$. A resolver has the same electrical characteristics as a transformer. Therefore, a transformer can be used to simulate a resolver. When switch S 2 is in the BRG position, precision bearing transformer T 2 and its switching circuits are used to produce the desired phase shift. The 30 -cycle reference signal from the radio receiver is applied through switch S 2 to the primary of transformer T2. This primary winding and resistor R3 simulate the rotor of a resolver. The phase shift through the secondary winding of the transformer must be the same as the phase shift in the stator windings of the resolver. This phase shift through transformer T2 is adjusted to $83^{\circ}$ at a dial setting of $300^{\circ}$ by the loading on the tertiary winding. The design of the transformer is such that the phase shift it produces is stable with variations in alternating current (ac) or direct current through the primary winding. The combination of the precisely tapped secondary windings of transformer T 2 and the switching arrangement (S3) produces the various voltage ratios that correspond to the stator output of a standard resolver. Each clockwise position of switch S3 simulates a clockwise rotation of a resolver rotor in precise $30^{\circ}$ increments. With switch S 2 in the BRG position, the output voltage path from transformer T2 is through switch S3, through switch S5 in Test Set, Radio TS-2500A/ARM-92, through switch S2,

## 1-4 Change 2

Figure 1-3. Indicator, Course ID-1347/ARN-82 or ID-1347A/ARN-82, schematic diagram.
and out to the radio receiver through pins F and D of connector P2. In Test Set, Radio TS-2500A/ARM-92, terminals 8 and 9 (stators E and G ) of transformer T 2 are common and connect to E of P6 and E of P2. In Test Set, Radio TS-2500A/ARM-92, stators $E$ and $G$ connect to P2, pins E and G, through switches S3, S5, and S2.

## 1-4.1. Resolver Transmitter Circuit

(Contained in Test Set, Radio TS-2500A/ARM-92 only, fig. 4-9.1 )

Radio Receiver R-1388A/ARN-82 requires $400-\mathrm{Hz}$ resolver signals to derive course deviation and to-from outputs. The
test set produces these signals either by energizing the OBS resolver or by energizing the precision bearing transformers.
a. BRG-OBS switch S2 determines which resolver circuit is used. When switch S 2 is in the OBS position, the OBS resolver is used to produce the desired course. The OBS indicator is the same type as used in an aircraft installation. The $400-\mathrm{Hz}$ reference signal is applied to the rotor of the resolver in the OBS indicator. When the rotor is turned, the voltage of the signal at stator output is varied. A compass card is attached to the rotor, providing an indication of the course selected. The voltage is routed to the radio receiver. For more information on the OBS indicator, refer to TM 11-5826-

226-35 for Radio Receiving Sets AN/ARN-82 and AN/ARN-82A. A schematic diagram of the OBS indicator is shown in figure 1-3.
b. A resolver has the same electrical characteristics as a transformer. Therefore, a transformer can be used to simulate a resolver. When switch S 2 is in the BRG position and RECEIVER MODEL switch S5 is in the B position, precision bearing transformers T2 and T3 and their switching circuits are used to produce the desired stator voltages. The $400-\mathrm{Hz}$ reference signal from the radio receiver is applied through switches S2, S5, and S3 to the primaries of transformers T2 and T3. These primary windings simulate the rotor of a resolver.

The combination of the precisely tapped secondary windings of transformers T 2 and T3 and the switching arrangement (S3) produces the various voltage ratios that correspond to the stator output of a standard resolver. Each clockwise position of switch S3 simulates a clockwise rotation of a resolver rotor in precise $30^{\circ}$ increments. With switch S 2 in the BRG position, the output voltage path from transformers T 2 and T3 is through switches S5 and S2 to the radio receiver on pins $D, E, F$, and $G$ of connector P2.

## 1-5. Current Measuring Circuits <br> (fig. 4-9 and 4-9.1)

The outputs of four circuits in the radio receiver are measured in the test set. These measuring circuits are described below.
a. To-from current from the radio receiver is read on meter M3. TO-FROM meter M3 indicates the direction and amplitude of the current. Resistor R8 is a shunt resistor to extend the range of the meter.
$b$. Deviation current from either the radio receiver or the glide-slope receiver is read on meter M1. With the switch S1 in the VOR/LOC position, pins $\mathrm{P}, \mathrm{B}$, and M of connector P 2 connect through switch S 1 to the DEVIATION meter. The return path from meter M1 is through stitch S1 back to connector P2. When switch S 1 is in the GLIDE SLOPE position, meter M1 connects through switch S1 to pin T
of GLIDE SLOPE connector J4. The completed path of meter M1 is through switch S1 to pin V of J 4 .
c. Flag current from either the radio receiver or the glide-slope receiver is read on FLAG meter M2. When switch S1 is in the VOR/LOC (very high-frequency omni-directional radio range/localizer) position, meter M2 is connected through switch S 1 to pin b of P2 by the contacts of relay K2. The completed path from the meter is through the other set of contacts of relay K2, through switch S1 to pins c and a of P2. With the switch S1 in the GLIDE SLOPE position, meter M2 is connected to pin v of J4 by switch S1 through the contacts of relay K2. The completed path of meter M2 is through the other contacts of relay K2, through switch S 1 to pin J on J4. FLAG meter M2 can also be used to measure the output current of the RMI servoamplifier in the radio receiver. When the SERVO AMP TEST switch S 4 is pressed, 27.5 volts dc from tie point 18 of TB1 is routed to the RMI (radio magnetic indicator) servoamplifier of the radio receiver and relay K 2 . When relay K 2 is energized, FLAG meter M2 is placed across RMI servoamplifier load resistor R5. Resistor R4 is a current-limiting resistor and diode CR1 rectifies the RMI servoamplifier output current that is applied to meter M2. Diode CR2 is used to short out any voltage caused by the collapsing field of relay K2 when switch S4 is opened.

## 1-6. Compass Simulator Circuits

fig. 4-9 and 4-9.1)
The COMPASS SIMULATOR indicator contains a synchro transmitter of the same type used with the compass in an aircraft installation. As the dial is turned, the synchro generates a varying voltage from the 26 volts, 400 Hz that is applied to the COMPASS SIMULATOR indicator. The output voltage from the synchro transmitter is routed to the radio receiver and the RMI card to simulate a magnetic heading. The pointer simulates the pointer of the compass in the aircraft.

## 1-7. RMI Circuits

The RMI card gives an indication of simulati ed magnetic heading. The simulated magnetic
heading signal originates in the compass simulator, and is routed to the RMI card. The RMI needles give an indication of the direction of a very high-frequency omnirange (vor) station. In the test set, two needles are electrically jumpered together. This makes the two needles track together. The vor signals are routed from the radio receiver to the needle connections on P4. If the RMI card rotates to indicate a magnetic heading, the needles will follow the card rotation to keep in the direction of the vor station. For more information on the RMI refer to TM 11-5826-211-50 for Indicator, Course ID-250A/ARN. The RMI is shown in figure 1-4

## 1-8. Aid Box

## (fig. 1-5)

The aid box is primarily intended for testing a new AN/ARN-82 or AN/ARN-82A installation wiring harness, but it can be used for a quick check on the test set. The main circuits are as follows:
a. Light Circuitry. The light circuitry is provided to indicated when a circuit is made complete or when it is energized. Frequency control information is given in a code by the lamps. The lamps that check the power circuits glow when a current flows through them, indicating an energized circuit.
b. Meter Circuitry. The 26 volts, 400 cps is applied to pin G of J 1 and is routed to Zener diode CR1. Resistor R8 and Zener diode CR1 form the 10 -volt dc power supply for the meter circuits. Resistor R6 is a current-limiting resistor for the TO-FROM meter. Resistor R5 is a current-limiting resistor for the DEVIATION meter. Resistor R3 (a 511-ohm load) and resistor R4 (a 1,000-ohm load) are the loading resistors for the DEVIATION meter. Resistor

Figure 1-4. Indicator, Course ID-250A/ARN, schematic diagram.

R2 is the current-limiting resistor for the FLAG meter, and resistor R1 is a 1,000 -ohm load for the FLAG meter.
c. Audio Circuit. Resistor R7 drops the 26 volts, 400 cps to the voltage level desired, and this 400 -cycle tone is fed to pin L of J 2 .
d. Compass RMI circuit. The signal from the compass simulator at pins C and D of J1 is connected to the RMI needle circuit through pins H and K of J 1 . This makes needle number 1 (needle number 2 is not used) of the RMI follow the rotation of the RMI card when the aid box is used to check the test set.

Figure 1-5. Test Set, Wiring Harness, Aircraft TS-2501/ARM-92, schematic diagram.

## CHAPTER 2

## TROUBLESHOOTING

## Section I. GENERAL TROUBLESHOOTING TECHNIQUES

Warning: Be careful when working on the 115 -volt, 400 -cps circuit. Serious injury or death may result from contact with this circuit.

## 2-1. General

The general support and depot maintenance procedures in this manual supplement the procedures in the organizational maintenance manual. The systematic troubleshooting procedure, which begins with the operational and sectionalization checks that can be performed at an organizational category, is carried to a higher category in this manual. Sectionalizing, localizing, and isolating techniques used in the troubleshooting procedures are more advanced.

## 2-2. Organization of Troubleshooting Procedures

a. General. The first step in servicing a malfunctioning test set is to sectionalize the fault. Sectionalization means tracing the fault to a unit or circuit. The second step is to localize the fault. Localization means tracing the fault to a defective part responsible for the abnormal condition. Some faults, such as burnedout resistors and arcing and shorted transformers can often be located by sight, smell, and hearing. The majority of faults, however, must be isolated by checking voltages and resistance.
b. Sectionalization. Listed below is a group of tests arranged to reduce unnecessary work and to aid in tracing trouble in a malfunctioning test set. Test Sets, Radio AN/ARM-92 and AN/ARM-92A consist of five units; the test set, the control unit, the RMI the OBS indicator and the aid box. The first step is
to locate the unit or units at fault by the following methods:
(1) Visual inspection. The purpose of visual inspection is to locate faults without testing or measuring circuits. Indications on the RMI meters, or other visual signs should be observed during all operating modes, and an attempt should be made to sectionalize the fault to a particular unit.
(2) Operational tests. Operational tests frequently indicate the general location of trouble. In many instances, the tests will help in determining the exact nature of the fault. The intermediate preventive maintenance checks and services chart (TM 11-6625-820-12) contains a list of operational checks which helps to sectionalize troubles to a unit.
c. Localization. After the trouble has been sectionalized ( $b$ above), the methods listed below will aid in localizing the trouble to a circuit in the suspected unit. See the troubleshooting chart for help in finding the trouble. RMI and meter indications or lack of indications and operational checks provides a systematic method of localizing trouble to a circuit. The procedures provided in the troubleshooting charts para 2-5 through 2-9) will provide additional information for localizing trouble.
d. Isolation. After the trouble has been localized (c above), the methods in (1) through (4) below will help in isolating the trouble to a defective circuit element.
(1) Resistance measurements. Resistance measurements are used to
check for continuity and to check the value of resistance in a circuit. For these checks, use Multimeter ME-26 (*) /U, or equivalent.
Caution: Be sure that the multimeter is not placed across a meter in the test set. The current from the ohmmeter might damage the microampere movement of a meter of the test set.
(2) Voltage measurements. Voltage measurements are used to check to see if the proper amount of voltage is being routed through the test set and aid box. For these measurements, use Multimeter $\mathrm{ME}-26(*) / \mathrm{U}$, or equivalent.
(3) Intermittent troubles. In all these tests, the possibility of intermittent troubles should not be overlooked. If present, this type of trouble may often be made to appear by tapping or jaring the equipment. Make a visual in-
spection of the wiring and connections.
(4) Resistor color code. The resistor color code diagram fig. 4-8 is provided to aid maintenance personnel in determining the value and tolerance of resistors.

## 2-3. Test Equipment Required

The following chart lists equipment required for troubleshooting Test Set, Radio AN/ARM92 or AN/ARM-92A. It also lists the associated technical manuals.
a. Make test equipment connections with care so that shorts will not be caused by exposed test equipment connectors. Tape or sleeve (spaghetti) test prods or clips as necessary to leave as little exposed metal as needed to make contact to the circuit under test.
$b$. Observe polarity; a negative ground is required on the 27.5 -volt dc line. The low side of the ac line is also grounded.
$c$. The following test equipment is required:

| Test Equipment | Technical manual | Common name |
| :---: | :---: | :---: |
| Modulator MD-83A/ARN | TM 11-6625-588-15 | Vor modulator |
| Output Meter TS-585(*)/U ${ }^{\text {a }}$ | TM 11-5017 | Output meter |
| Multimeter ME-26(*)/U ${ }^{\text {b }}$ | TM 11-6625-200-12 | Multimeter |
| Oscilloscope AN/USM-140A | TM 11-6625-535-15 | Oscilloscope |
| Voltmeter, Meter ME-30A/U and Voltmeters, Electronic ME-30 $\left(^{*}\right) / \mathrm{U}^{\mathrm{c}}$ | TM 11-6625-320-12 | Vtvm |
| Test Set, Resolver AN/ASM-101 | TM 11-6625-492-12 | Resolver test set |
| Test Set, Indicator Course AN/ASM-110 |  | Indicator test set |
| Meter Test Set TS-682A/GSM-1 | TM 11-2535B | Meter calibrator |
| Bridge, Resolver, Gertsch model RB-4C-4R; Singer Company, Los Angeles, California |  | Resolver bridge |

Indicates Output Meters TS-585A/U, TS-585B/U, TS-585C/U, and Audio Level Meter TS-585D/U.
b Indicates Multimeter ME-26A/U, ME-26B/U, and ME-26C/U.
c Indicates Voltmeter, Meter ME-30A/U and Voltmeters, Electronic ME-30B/U and ME-30C/U.

## Section II.TROUBLESHOOTING PROCEDURES

## 2-4. General

The troubleshooting procedures are divided into two parts. The first part (paras 2-5 and 2-6) gives procedures to troubleshoot the aid box. The second part (paras 2-7 hrough 2-9) gives procedures to troubleshoot the control unit, the RMI the OBS indicator, and the test set.

## $2-5$. Troubleshooting Aid Box

Because of the simplicity of the aid box circuitry, any trouble may be quickly isolated by the following checks:
a. Remove the bottom of the aid box by removing the six screws on the bottom of the aid box.

## 2-2 Change 2

b. Connect P2 and P3 of the test set to the aid box.
c. Connect the test set to a 27.5 volt dc powe r source, and a 115 -volt, $400-\mathrm{cps}$ power source.
d. Set the power switch on the control unit to PWR.
$e$. Connect the dc lead of the multimeter to the junction of Zener diode CR1 and resistor R8. Connect the COMMON lead to the anode of Zener diode CR1.
$f$. The multimeter should indicate 10 volts dc $\pm 0.05$. If the indication is improper, replace the defective Zener diode CR1.
$g$. All other circuits in the aid box may be checked by using the resistance chat in paragraph 2-6 Remove all equipment connected to the aid box before attempting resistance measurements. When an improper resistance reading is obtained, refer to the schematic diagram in figure 1-5 to isolate the trouble.

| Multimeter connection |  | $\begin{gathered} \text { Proper indication } \\ \text { (ohms) } \end{gathered}$ |
| :---: | :---: | :---: |
| From | To |  |
| A of J2 | a of J2 | $22,900 \pm 2,290$ |

| A of J2 | X of J2 | $160 \pm 20$ |
| R of J2 | X of J2 | $160 \pm 20$ |
| K of J2 | X of J2 | $160 \pm 20$ |
| G of J1 | E of J1 |  |
|  |  |  |

## 2-7. Troubleshooting Control Unit, RMI OBS Indicator, and Test Set

a. Perform the general support testing procedures for the aid box in paragraph 4-7. If the general support testing procedures indicate trouble, perform the troubleshooting procedures described in paragraph 2-5
$b$. Connect the test set to the aid box and external power as shown in figure 2-1.
c. Set the power switch on the test set control unit to OFF.
d. Set the VOR/LOC-GLIDE SLOPE switch on the test set to VOR/LOC. (All other switches and controls may be set in any position. )
$e$. Perform the procedures in the troubleshooting chart in paragraph 2-8. This chart gives various operational procedures for the test set. The proper indication for each operational procedure is then given. If the equipment produces an improper indication, the chart lists the probable trouble and, in the Correction column, suggests how to isolate the trouble.

Figure 2-8. Power cable.

| Step | Procedure | Proper indication | Probable trooble for <br> improper indication | Correction |
| :---: | :---: | :---: | :---: | :---: |
| 1 | Connect the multimeter to <br> the test point located in | The multimeter should indicate <br> 27.5 volts dc. | VOR/LOC 2A fuse (F1) is <br> blown. | Replace F1 with a 2-ampere fuse. |
|  | the center of the VOR/ |  |  |  |
| 2 | LOC 2A fuse cap. | Set the megacycle and kilo- | The following lamps should light: |  |

a. If the LOC PWR lamp on the aid box does not light, either a break in the circuit is present between M of P5 and A of P2, or switch S6A in the control unit is defective.
b. If the VOR/LOC DC lamp on the test set does not light, DS1 is faulty.
c. If the 26 VAC PWR lamp on the aid box does not light, VOR/LOC 1A fuse is brown, relay K 1 is defective, or transformer T1 is defective.
d. If the VOR/LOC AC lamp on the test set does not light, DS3 is faulty.
e. If the GS DC lamp on the test set does not light, either GS 1A fuse (F2) is blown or GS DC lamp (DS2) is burned out.
a. If a break in the circuit is present between M of P5 and $A$ of $P 2$, make resistance measurements to find the break. If no breaks are present, troubleshoot the control unit as described in TM 11-5826-226-35.
b. Replace DS1.
c. Measure the ac voltage at the test point located at the center of the VOR/LOC 1A fusecap. If 26 volts ac is not present, replace fuse F3. If 26 volts ac is present, check for a defective relay K1 by measuring its coil resistance (para 2-9). If defective, replace relay K1. Check for a defective transformer by measuring its resistances (para 2-9). Replace if defective.
d. Replace DS3.
e. Measure the dc voltage at the test point located at the center of the GS 1A fusecap. If 27.5 volts dc is not present, replace fuse F2. If 27.5 volts dc is present, replace lamp DS2.

| Steep | Procedure | Proper indication | Probable trouble for improper indication | Correction |
| :---: | :---: | :---: | :---: | :---: |
|  |  | $m$. The TO-FROM meter should indicate 500 microamperes $\pm 25.0$ to the left of 0. | $m$. If the TO-FROM meter does not indicate 500 microamperes $\pm 25.0$ to the left of zero, resistor R8 or TO-FROM meter M3 is defective. | m. Disconnect resistor R8 from meter M3, and measure the resistance of R8. If the value of R 8 is not between 180 and 220 ohms, replace R8. If the value is between 180 and 220 ohms, replace meter M3. |
| 3 | Set the power switch on the control unit to TEST. | The TEST lamp on the aid box should light in addition to the lamps lighted in step 2 above. | Either a break in the circuit is present between t of P 2 and L of P5, or switch S 6 C in the control unit is defective. | If a break in the circuit is present between $t$ of P2 and L of P5, make resistance measurements to find the break. If no break is present, troubleshoot the control unit as described in TM 11-5826-226-35. |
| 4 | Set the power switch on the control unit to PWR. Set the megacycle and kilocycle selectors to $\mathbf{1 0 8 . 0 5}$. | Note. The 1.0 FREQ SELECT <br> (MC) lamps A and D should remain lighted in step 4 through 22 below. <br> The 0.1 FREQ SELECT <br> (MC) lamps B and E should light. | If either one, or both, of the lamps do not light, the kilocycle selector on the control unit is defective. | Troubleshoot the control unit as described in TM 11-5826-226-36. |
| 5 | Set the megacycle and kilocycle selectors to 108.10. | The 0.1 FREQ SELECT (MC) lamps A and B should light. The 0.01 FREQ SELECT (MC) lamp B should light. The GS/ LOC ON lamp should light. | a. If 0.1 FREQ SELECT (MC) lamp A does not light, either a break in the circuit is present between f of P 2 and C of P5, or the kilocycle selector in the control unit is defective. <br> b. If 0.1 FREQ SELECT (MC) lamp B does not light, the kilocycle selector on the control unit is defective. <br> c. If GS/LOC ON lamp does not light, either a break in the circuit is present between $k$ of P2 and Y or P5, or the kilocycle selector in the control unit is defective. | a. If a break in the circuit is present. make resistance measurements to find the break. If no break is present, troubleshoot the control unit as described in TM 11-5826-226-35. <br> b. Troubleshoot the control unit as described in TM 11-5826-226-35. <br> c. If a break in the circuit is present, make resistance measurements to find the break. If no break is present, troubleshoot the control unit as described in TM 11-5826-226-35. |

| Stes | Procedure | Proper indication | Probable trouble for improper indication | Correction |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | b. | K2 | 1 to 8 | $280 \pm 28$ |

## CHAPTER 3

## REPAIR AND ALIGNMENT

## Section I. REPAIRS

## 3-1. General Parts Replacement Techniques

The following general precautions should be observed when replacing parts in this equipment.
$a$. When soldering or unsoldering components, solder quickly to allow as little heat conduction as possible, Whenever wiring permits, use a heat sink (such as a long-nosed pliers) between the solder joint and the component. Use approximately the same length and dress of leads as used originally.
b. Use a pencil-type iron with a 25 -watt maximum capacity. If the iron must be used with ac, use an isolation transformer between the iron and the line. Check soldering irons for shorts to the iron tip before using.
c. Whenever an electrical part such as a resistor or diode is to be removed, note the exact position of the component before removing it. Replace the component in the same position.

## 3-2. Removal and Replacement Techniques

The procedures for removal and disassembly of the units in the test set are described in paragraph 3-3. The corresponding replacement, reassembly, and lubrication techniques are described in paragraph 3-4. The procedures for disassembly of the aid box are described in paragraph 3-5. The corresponding reassembly techniques are described in paragraph 3-6

## 3-3. Removal and Disassembly Techniques for Test Sets, Radio TS-2500/ARM-92 and TS-2500A/ARM-92

a. Removal of Test Set Front Panel
(1) Remove the 13 screws from the perimeter of the front panel.
(2) Lift the front panel away from the test set.
(3) Disconnect the power cable from the chassis.

Note. To allow enough slack to conveniently work on the test set, the pendant cables may be pulled through the porthole in the bottom of test set.
b. Removal of Control Unit.
(1) Loosen the four Dzus fasteners.
(2) Pull the control unit away from the front panel of the test set.
(3) Disconnect the cable attached to the control unit.
c. Disassembly of Control Unit. Refer to TM 11-5826-226-35 for disassembly procedures of Control, Radio Set C-6873/ARN82.
d. Removal of OBS Indicator.
(1) Remove the four screws that hold the OBS indicator to the front panel of the test set.
(2) Pull the OBS indicator away from the front panel of the test set.
(3) Disconnect the cable attached to the OBS indicator.
e. Disassembly of OBS Indicator. Refer to TM 11-5826-226-35 for disassembly procedures of Indicator, Course ID-1347/ARN-82, or ID-1347A/ARN-82.
f. Removal of RMI
(1) Remove the four screws that hold the RMI to the front panel of the test set.
(2) Pull the RMI away from the front panel of the test set.
(3) Disconnect the cable attached to the R MI
g. Disassembly of RMI. Refer to TM 11-5826-211-50 for disassembly procedures for Indicator, Course ID-250A/ARN.
h. Removal of COMPASS SIMULATOR indicator.
(1) Remove the test set front panel (a above).
(2) Remove the three screws that hold the COMPASS SIMULATOR indicator to the front panel of the test set.
(3) Pull the COMPASS SIMULATOR indicator away from the front panel.
(4) Disconnect the cable attached to the COMPASS SIMULATOR indicator.
i. Disassembly of COMPASS SIMULATOR indicator (fig. 3-1).
(1) Remove four screws (30) and four lockwashers (29) from connector P1 (28).
(2) Pull connector P1 (28) away from rear housing (23) to allow enough space to unsolder leads attached to connector. Label these leads to identify them for reassembly. Remove gasket (27).
(3) Set COMPASS SIMULATOR indicator down on a flat surface.
(4) Remove eight screws (25) and eight lockwashers (24).
(5) Pull front cover (5) away from rear housing (23).
(6) Remove gasket (22).
(7) Separate front cover (5) from synchro housing (17).

Note. To remove dial window (9), push carefully on front side of dial window (9) to remove it from front cover (5) and windowseal (8).
(8) Loosen two setscrews (2 and 3). Remove knob (1) and spring washer (4).
(9) Pull out drive gear (7). Remove shaft sleeve (6).
(10) Pull needle (11) straight off shaft of synchro B1 (21).
(11) Rotate synchro gear (13) until setscrew (14) lines up with hole in smaller rim of synchro housing (17). Loosen this setscrew.
(12) Repeat step in (11) above to loosen setscrew (14).
(13) Remove dial retainer (10) and dial (12).
(14) Remove synchro gear (13) and idler gear (16).
(15) Remove three screws (20), three lockwashers (19), and three synchro clamps (18).
(16) Pull synchro B1 (21) off synchro housing (17).
j. Removal of FLAG Meter.
(1) Remove the test set front panel ( $a$ above).
(2) Disconnect the two wires attached to the meter. Label these wires for identification when replacing the meter.
(3) Remove the four nuts that hold the meter to the test set.
(4) Pull the meter out of the front panel.
k. Removal of DEVIATION Meter.
(1) Remove the test set front panel ( $a$ above).
(2) Disconnect the two wires attached to the meter. Label these wires for identification when replacing the meter.
(3) Remove the four nuts that hold the meter to the test set.
(4) Pull the meter out of the front panel.
l. Removal of TO-FROM Meter.
(1) Remove the test set front panel ( $a$ above).
(2) Disconnect the two wires attached to the meter. Label these wires for identification when replacing the meter.
(3) Remove the four nuts that hold the meter to the test set.
(4) Pull the meter out of the front panel.

## 3-4. Replacement, Reassembly, and Lubrication Techniques for Test Sets, Radio TS-2500/ARM-92 and TS-2500A/ARM-92

a. Replacement of TO-FROM Meter.
(1) Place the meter back in the front panel.
(2) Replace the four nuts to hold the meter to the front panel.
(3) Connect the two wires to their proper terminal on the meter.
(4) Replace the test set front panel ( $l$ below).
b. Replacement of Deviation Meter.
(1) Place the meter back in the front panel.
(2) Replace the four nuts to hold the meter to the front panel.
(3) Connect the two wires to their proper terminal on the meter.
(4) Replace the test set front panel ( $l$ above).
c. Replacement of FLAG Meter.
(1) Place the meter back in the front panel.
(2) Replace the four nuts to hold the meter to the front panel.
(3) Connect the two wires to their proper terminals on the meter.
(4) Replace the test set front panel ( $l$ above).
d. Reassembly of COMPASS SIMULATOR Indicator (fig. 3-1),
(1) Replace synchro B1 (21) to synchro housing (17).
(2) Replace three synchro clamps (18), three lockwashers (19), and three screws (20).
(3) Replace synchro gear (13).
(4) Rotate synchro gear (13) until the setscrew (15) lines up with the hole in the smaller rim of synchro housing (17). Tighten this setscrew.
(5) Repeat step in (4) above to tighten setscrew (14).
(6) Replace idler gear (16).
(7) Replace dial (12) and retainer (10).
(8) Push needle (11) straight on the shaft of synchro B1 (21) until it is properly in place. Align the COMPASS SIMULATOR indicator (para 3-10).
(9) Replace shaft sleeve (6). Lubricate inside of shaft sleeve (6) with Dow Corning Stopcock grease Replace drive gear (7).
(1o) Replace spring washer (4). Replace knob (1) and tighten two setscrews (2 and 3).
(11) Replace front cover (5) to synchro housing (17).

Note. If dial window (9) has been removed, replace the window by very carefully pushing it back into the front cover (5) before replacing the front cover.
(12) Replace gasket (22) to rear housing (23).
(13) Replace front cover (5) to rear housing (23).
(14) Replace eight lockwashers (24) and tighten eight screws (25).
(15) Replace gasket (27).
(16) Solder the leads to the proper points on connector P1 (28).
(17) Replace four lockwashers (29) and tighten four screws (30).
e. Replacement of COMPASS SIMULATOR Indicator.
(1) Connect P1 to the COMPASS SIMULATOR Indicator.
(2) Replace the COMPASS SIMULATOR Indicator in the front panel.
(3) Replace the three screws and nuts, to hold the COMPASS SIMULATOR Indicator to the front panel.
(4) Replace the test set front panel ( 1 below).
f. Reassembly and Lubrication of RMI. Refer to TM 11-5826-211-50 for reassembly and lubrication procedures for Indicator, Course ID-250A/ARN.
g. Replacement of RMI.
(1) Connect P4 to the RMI connector.
(2) Replace the RMI in the front panel.
(3) Replace the four screws to hold the RMI to the front panel.
(4) Replace the test set front panel ( $l$ below).
h. Reassembly and Lubrication of OBS Indicator. Refer to TM 11-5826-226-35 for reassembly and lubrication procedures for Indicator, Course ID-1347/ARN-82 or ID-1347A/ ARN-82.
i. Replacenwnt of OBS Indicator.
(1) Connect P6 to the OBS connector.
(2) Replace the OBS indicator in the front panel.
(3) Replace the four screws, to hold the OBS indicator to the front panel.
(4) Replace the test set front panel ( $l$ below).

Figure 3-1. COMPASS SIMULATOR Indicator, exploded view.
j. Reassembly and Lubrication of Control Unit. Refer to TM 11-5826-226-35 for reassembly and lubrication procedures for Control, Radio Set C-6873/ARN-82.
k. Replacement of Control Unit.
(1) Connect P5 to the control unit connector.
(2) Replace the control unit in the front panel.
(3) Tighten the four Dzus fasteners.
l. Replacement of Front Panel.
(1) Connect the power cable to J5.
(2) Place the front panel back in the lower carrying case. Be sure no cables are pinched between the chassis and the carrying case.
(3) Replace the 13 screws in the perimeter of the front panel.

## Section II.

## 3-7. General

Alignment procedures for Test Sets, Radio AN/ARM-92 and AN/ARM-92A are given in paragraphs 3-9 through 3-13. The precision bearing alignment is given in paragraph 3-9 Alignment of the COMPASS SIMULATOR indicator is given $n$ paragraph 310. References to the alignment procedures are given for the OBS indicator, RMI and control unit in paragraphs 3-11 through 3-13. References to the test equipment required are given in paragraph 3-8

## 3-8. Test Equipment Required for Alignment

Refer to paragraph 2-3 for a list of the test equipment required for alignment procedures.

## 3-9. Precision Bearing Alignment

a. Remove the test set front panel (para 3-3 a).
b. A special cable is required for precision bearing alignment. Refer to paragraph 4-4 for construction details of this cable.
$c$. Connect the equipment as shown in figure $2-9$, and calibrate the resolver test set. (Refer to TM 11-6625-492-12 for calibration of Test Set, Resolver AN/ARM-101.)

## 3-5. Disassembly Techniques for Test Set, Wiring Harness, Aircraft TS-2501/ARM-92

Remove the bottom panel of the aid box as follows:
a. Remove the six screws that hold the bottom panel in place.
b. Lift the bottom panel away.

## 3-6. Reassembly Techniques for Test Set, Wiring Harness, Aircraft TS-2501/ARM-92

Replace the bottom panel of the aid box as follows:
a. Place the bottom panel on the aid box.
$b$. Replace the six screws, to hold the bottom panel in place.

## ALIGNMENT

d. Disconnect the MOD OUTPUT connector of the vor modulator from the VAR connector of the resolver test set.
$e$. Connect the INPUT of the vacuum-tube voltmeter (vtvm) to the VOLTMETER connector on the resolver test set.
$f$. Set the function switch on the resolver test set to SET ORZ.
g. Adjust the INPUT LEVEL control on the resolver test set for 4.25 -volt indication of the vtvm.
h. Remove the INPUT of the vtvm from the VOLTMETER connector, and connect it to the OUTPUT connector on the resolver test set.
i. Set the VOR/LOC-GLIDE SLOPE switch on the test set the VOR/LOC.
$j$. Set the BEARING selector switch on the test set to 300 .
k. Unlock potentiometer R1 located behind the front panel of the test set.
$l$. Alternately adjust the AMP.BAL. control on the resolver test set and potentiometer R1 in the test set to obtain the least possible signal amplitude (minimum null) as observed on the oscilloscope.

Note. As the null is approached, increase the vertical gain of the oscilloscope.
$m$. Lock potentiometer R1 shaft.
$n$. If aligning Test Set, Radio TS-2500/
ARM-92, disconnect the equipment and replace the test set front panel. Omit steps o through $z$.
$o$. Disconnect the test set from the resolver test setup (fig. 2-9). Connect the test set and the resolver bridge as shown in figure 3-2. Use the cable fabricated in paragraph 4-4 fig. 4-1.2).
p. Disconnect the wire to the wiper connection of wafer H of switch S3 fig. 3-3.
q. Connect jack J7 of the fabricated cable to the pin from which the wire was removed in step p .
$r$. Set the test set BEARING switch to 300 and the resolver bridge angle switch to 0 degree.
$s$. Adjust the oscilloscope gain controls to obtain a line of approximately 20 degrees slope from the horizontal (disregard any ballooning).
$t$. With grease pencil or equivalent, draw the slope line on the oscilloscope face; this is the maximum negative angle. Draw a line of the same slope but the opposite direction from the horizontal line; this is the maximum positive angle.
u. Disconnect the jumper from J7 of the fabricated cable to the test set.

Figure 3-2. TS-2500A/ARM-92 precision BEARING alignment.
v. Reconnect the wire disconnected in step $p$.
$w$. Rotate the test set BEARING switch and the resolver bridge angle switch simultaneously in 30-degree steps and note the amount of error and the direction the line on the oscilloscope slopes.
$x$. If the error exceeds the limit set in step $t$, refer to the transformer error correction chart in paragraph 3-9.1
y. Repeat steps $c$ through $y$ until all error limits are met.

Figure 3-3. TS-2500A/ARM-92 switch S3 wafer and pin designation.

## 3-9.1. Transformer Error Correction

 Chart| Symptom | Corrective action |
| :---: | :---: |
| Positive error at 90 degrees |  |
| Positive error at 60 degrees greater than error at 90 degrees. | Add resistance between terminals 9 and 10 of T2 to reduce error at 60 degrees; then add resistance between terminals 10 and 11 of T2 to reduce error at 90 degrees. |
| Positive error at 60 degrees less than error at 90 degrees. | Add resistance between terminals 10 and 11 of T2 to reduce error at 90 degrees; then add resistance between terminals 9 and 10 of T2 to reduce error at 60 degrees. |
| No or small negative error at 60 degrees. | Add resistance between terminals 10 and 11 of T 2 to reduce error at 90 degrees; then add resistance between terminals 10 and 11 of T 1 to reduce error at 60 degrees. |
| Negative error at 60 degrees greater than error at 90 degrees. | Add resistance between terminals 10 and 11 of T1 to reduce error at 60 degrees; then add resistance between terminals 10 and 11 of T2 to reduce error at 90 degrees. |

Negative error at 90 degrees

Negative error at 60 degrees greater than error at 90 degrees.

Negative error at 60 degrees less than error at 90 degrees.

Add resistance between terminals 10 and 11 of T1 to reduce error at 60 degrees; then add resistance between terminals 9 and 10 of T1 to reduce error at 90 degrees.

Add resistance between terminals 9 and 10 of T 1 to reduce error at 90 degrees; then add resistance between terminals 10 and 11 of T1 to reduce error at 60 degrees.

| Symptom | Correctise action |
| :---: | :---: |
| No or small positive error at 60 degrees. <br> Positive error at 60 degrees greater than error at 90 degrees. | Add resistance between terminals 9 and 10 of T1 to reduce error at 90 degrees: then add resistance between terminals 9 and 10 of T2 to reduce error at 60 degrees. <br> Add resistance between terminals 9 and 10 of T 2 to reduce error at 60 degrees; then add resistance between terminals 9 and 10 of T1 to reduce error at 90 degrees. |
| No error at 90 degrees |  |
| Positive error at 60 degrees. <br> Negative error at 60 degrees. | Add resistance between terminals 9 and 10 of T2 to reduce error at 60 degrces: then add resistance between terminals 9 and 10 of T1 to correct error induced at 90 degrees. <br> Add resistance between terminals 10 and 11 of T2 to reduce error at 60 degrees: then add resistance between terminals 10 and 11 of Tl to correct error induced at 90 degrees. |

## 3-10. COMPASS SIMULATOR Indicator Alignment

a. Remove the test set front panel (para 33h).
b. Connect the test set to a 27.5 -volt dc power source, and a 115 -volt, $400-\mathrm{cps}$ power source.
c. Set the power switch on the control unit to PWR. (All other controls and switches on the control unit and test set may be in any position.)

Caution: In the following steps, remove the vtvm power cord from ground to eliminate the possibility of shorting across the external power source.
d. Connect the vtvm between pins C and D of connector P3 of the test set pendant cable.
$e$. With the compass simulator control, rotate the COMPASS SIMULATOR indicator for a null indication on the vtvm.

Note. A $360^{\circ}$ rotation of the COMPASS SIMULATOR indicator will produce two nulls on the vtvm. To determine the correct null, measure the ac voltage between pins C and G of connector P3. This ac voltage will be less than 26 volts ac when the correct null is found.
$f$. With the COMPASS SIMULATOR indicator set to the correct null, perform the fol-
lowing procedure to zero the COMPASS SIMULATOR indicator needle.
(1) Remove the rear housing of the COMPASS SIMULATOR indicator.
(2) Loosen the three screws that hold synchro B1 to the housing.
(3) Rotate the entire synchro until the COMPASS SIMULATOR indicator needle points exactly to N .
(4) Tighten the three screws that hold synchro B1 to the housing.
(5) Set the power switch on the control unit to OFF.
(6) Replace the rear housing of the COMPASS SIMULATOR indicator.
$g$. Disconnect the equipment, and replace the front panel on the test set.

## 3-11. OBS Indicator Alignment

Refer to TM 11-5826-226-35 for alignment procedures of Indicator, Course ID-1347/ ARN-82, and ID-1347A/ARN-82.

## 3-12. RMI Alignment

Refer to TM 11-5826-211-50 for alignment procedures of Course Indicator ID-250A/ ARN.

## CHAPTER 4

## GENERAL SUPPORT TESTING PROCEDURES AND DEPOT OVERHAUL STANDARDS

## 4-1. General

a. Testing procedures are prepared for use by general support and depot maintenance shops responsible for general support and depot maintenance of electronic equipment to determine the acceptability of repaired electronic equipment. These procedures set forth specific requirements that repaired electronic equipment must meet before it is returned to the using organization. The testing procedures are to be used for both general support testing procedures and depot overhaul standards. Applicable procedures of the Army depots performing these tests and the general standards for repaired electronic equipment given in TB SIG 355-1, TB SIG 355-2, and TB SIG 355-3 form a part of the requirements for testing this equipment. A summary of the performance standards is given in paragraph 4-16.
b. Comply with the instructions preceding the body of each chart before proceding to the chart. Perform each test in sequence. Do not vary the sequence. For each step, perform all the actions required in the Control settings columns; then perform each specific test procedure, and verify it against its performance standard.

## 4-2. Test Equipment, Tools, and Materials

All test equipment, tools, materials, and other equipment required to perform the testing procedures given in this section are listed in the following charts and are authorized under TA-11-17, Signal Field Maintenance Shops, and TA-11-100(11-17), Allowances of Signal Corps Expendable Supplies for Field Maintenance Shop, Continental United States.

| Nomenclature | Federal stock number | Technical manual |
| :---: | :---: | :---: |
| Modulator MD-83A/ARN | 6625-539-8563 | TM 11-6625-588-15 |
| Output Meter TS-585(*)/ U | 6625-244-0501 | TM 11-5017 |
| Voltmeter, Meter ME$30 \mathrm{~A} / \mathrm{U}$ and Voltmeter, Electronic ME-30(*)/ U | 6625-669-0742 | TM 11-6625-320-12 |
| Multimeter ME-26(*)/U | 6625-542-6407 | TM 11-6625-200-12 |
| Test Set, Resolver AN AN/ASM-101 | 6625-086-7844 | TM 11-6625-492-12 |
| Oscilloscope AN/USM- $140 \mathrm{~A}$ | 6625-987-6603 | TM 11-6625-535-15 |
| Meter Test Set TS-682A/ GSM-1 | 6625-669-0747 | TM 11-2535B |

b. Tools. All tools required are contained in Tool Kit, Electronic Equipment TK-105/G, Federal Stock No. 5180-610-8177.
c. Materials.
(1) $1 / 4$-inch barrel diameter.
(2) Telephone plug (1/4-inch diameter barrel).
(3) Wire, copper, insulated, stranded \# 22 AWG (40 feet long).
(4) Connectors (3), Bendix PTO1A-2040P(SR).
(5) Connector, Bendix PTO1A-12-10P (SR).
(6) Clamp MS3057-10A.
(7) Connector MS3106A-18S-1S.
(8) Connector MS3116A-18-32SW.
(9) Binding posts (7) Superior Electric Company DF 30RC.
(10) Spaghetti, 3/4-inch diameter (5.5 feet long).
(11) Small enclosed metal box $3 \times 4 \times 5$ inches.

## 4-3. Test Facilities

Primary power requirements are 27.5 volts dc at 33 watts and 115 volts, 400 cps at 92 watts. Temperature, humidity, and atmospheric pressure are not critical.

## 4-4. Fabricated Cable Construction Details

Fabricated cables are required to connect the test set to Test Set, Resolver AN/ASM101 and Test Set, Indicator, Course AN/

ASM-110. Refer to figures 4-1, 4-1.1, and $4-1.2$ and construct the cables as described below.
a. Resolver Test Set and Indicator Test Set Cables.
(1) Solder six 2-foot lengths of \# 22 AWG stranded, insulated wire to pins C, D, E, F, G, and H of each male connector P1.
(2) Label the loose ends of the six wires with the pin number to which each wire is connected.
(3) Slip a 2-inch length of spaghetti over the loose ends of the six wires.
(4) Place clamp MS3057-10A over the end of the spaghetti on the resolver test set cable.
(5) Connect the loose ends of the six wires to the pins of the J1 female connectors as shown in figures 4-1 and 4-1.1.

Figure 4-1. Fabricated cable to resolver test set, construction details.

Figure 4-1.1. Fabricated cable to indicator test set, construction details.
4-2 Change 2
(6) Tighten the clamps around the J1 connectors on each cable.
b. Resolver Bridge Cable.
(1) Solder six 2 -foot lengths of \# 22 AWG stranded insulated wire to pins C, D, E, F, G, and H of male connector P1.
(2) Solder two 2-foot lengths of \# 22 AWG stranded insulated wire to pins G and E of male connector P 2 .
(3) Label the loose ends of the six wires with the pin number to which each wire is connected.
(4) Slip a 2-inch length of spaghetti over the loose end of the eight wires.
(5) Mount and label seven binding posts on a small enclosed metal box fig. 3-2).
(6) Connect a 21.5 -kilohm, $\pm 1 \%$, $1 / 2$ watt resistor from binding post J6 to binding post J7.
(7) Connect a $21.5-\mathrm{ohm}, \pm 1 \%, 1 / 2$-watt resistor from binding post $J 5$ to binding post J7.
(8) Connect the loose ends of the eight wires to the binding posts as shown in figure 4-1.2.

## 4-5. Modification Work Orders

The performance standards listed in the tests (paras 4-6 through 4-15) assume that the modification work orders, if any, have been performed. A listing of current modification work orders will be found in DA Pam 310-4.

NOTE:
$J I$ THROUGH $J T$ ARE BINDING POSTS. SUPERIOR ELECTRIC COMPANY PART NO. OF 3ORC OR EQUIVALENT.

EL6625-820-45-C1-TM-31

Figure 4-1.2. Fabricated cable to resolver bridge, construction details.

4-6. Test Set, Wiring Harness, Aircraft TS-2501/ARM-92 Physical Tests and Inspection
a. Test Equipment and Materials. None required.
b. Test Connections and Conditions. Remove the cover from the bottom of the aid box.
c. Procedure.

| Control setting: |  |  | Test procedure | Performance standard |
| :---: | :---: | :---: | :---: | :---: |
| Step | Test equidment | Equipment under test |  |  |
| 1 | N/A | N/A | a. Inspect for loose or missing screws, nuts, or bolts. <br> b. Inspect insulation of wiring for cuts, pinches, and signs of burning. <br> c. Check resistors for cracks and signs of burning. <br> d. Inspect connector for bent pins and cracked insulation material. <br> $e$. Inspect for coldsoldered connections. <br> $f$. Check for loose or missing lamps. <br> g. Inspect the chassis for the condition of the finish and panel lettering. <br> Note. Touchup painting is recommended instead of refinishing whenever practicable. Screwheads, binding posts, connectors, and plated fastener parts will not be painted or polished with abrasives. <br> Check the aid box for applicable modification work orders (para 4-5). | a. Screws, nuts, and bolts will be tight; none missing. <br> b. No cuts, pinches, or signs of burning evident. <br> c. No signs of cracks or burning evident. <br> d. No bent pins or cracked insulation evident. <br> e. No cold-soldered connections evident. <br> $f$. Lamps should be tight; none missing. <br> g. External surfaces intended to be painted will not show bare metal. Panel lettering will be legible. |
| 2 | N/A | N/A | Clieck the aid box for applicable modification work orders (para 4-5). |  |

## APPENDIX B

## DIRECT SUPPORT, GENERAL SUPPORT, AND DEPOT REPAIR PARTS

## Section I. INTRODUCTION

## B-1. General

This appendix lists the quantities of repair parts, Section II, for general support and depot maintenance and is a basis for requisitioning authorized parts. It is also a guide for depot maintenance in establishing initial categories of spare parts.

Note. No special tools, test, and support equipment are required.

## B-2. Explanation of Columns

An explanation of the columns is given below.
a. Sequence Number Column. This column is for sequential line item control, commencing with the first line item on the first page of the list, and continuing numerically to the last item on the page of the list.
b. For Authorized Allowance See Sequence Number Column. This column lists the numerical sequence number for items that have more than one occurrence throughout the list and refers to the first occurrence for authorized allowances.
c. Source, Maintenance, and Recoverability Code Column. Source, maintenance, and recoverability codes indicate the commodity command responsible for supply, the maintenance category at which an item is stocked, categories at which an item is installed or repaired, and whether an item is repairable or salvageable. The source code column is divided into four parts.
(1) Column A. This column indicates the materiel code and designates the area of responsiblity for supply. AR 310-1 defines the
basic numbers used to identify the materiel code. If the part is electronic materiel responsibility, the column is left blank.
(2) Column B. This column indicates the point within the maintenance system where the part is available. Source codes and their explanations are as follows:

$$
\text { Code } \quad \text { Explanation }
$$

$P$ - Applies to repair parts that are stocked in or supplied from the GSA/DSA, or Army supply system, and authorized for use at indicated maintenance categories.
X1 - Applies to repair parts that are not procured or stocked, the requirement for which will be supplied by the use of next higher assembly or component.
$X 2$ - Applies to repair parts that are not stocked. The indicated maintenance category requiring such repair parts will attempt to obtain them through cannibalization; if not obtainable through cannibalization, such repair parts will be requisitioned with supporting justification through normal supply channels.
Note. "AH" and "MD" applies to parts that require manufacture or assembly at a category higher than that authorized for installation will indicate in the source code column the higher category.
(3) Column C. This column indicates the lowest maintenance category authorized to install the part.

| Code | Explanation |
| :--- | :--- |
| $O$ | Organizational Maintenance |
| $H$ | General Support Maintenance |

(4) Column $D$. The symbol in this column indicates whether the item is repairable or salvageable. Recoverability code and its explanation is as follows:

## Code Explanation

$R$ - Applies to repair parts and assemblies that are economically repairable at DSU and GSU activities and normally are furnished on an exchange basis.
d. Federal Stock Number Column. This column lists the 11-digit Federal stock number.
$e$. Indent Code Column. This column indicates the breakdown of each given part or assembly. Components, assemblies, and subassemblies are listed in top-down order. That is, the assemblies which are part of a component are listed immediately below that component, and the subassemblies which are part of an assembly are listed immediately below that assembly.
f. Description Column. The Federal item name, a five-digit manufacturer's code, and a part number are included in this column.
$g$. Unit of Issue Column. The unit of issue is the supply term by which the individual item is counted for procurement, storage, requisitioning, allowances, and issue purposes.
h. Expendability Column. Nonexpendable items are indicated by NX. Expendable items are not annotated.
i. Quantity in Use Column. This column lists the quantity of each part found in a given assembly or component. "A/R" indicates that the item may be requisitioned "as required"; however, estimated minimum quantities may be stocked to cover immediate needs.
j. Quantity Per Equipment Column. This column lists the total quantity of each part, assembly, or component required for use in the overall equipment. Subsequent appearances of the same item in the same assembly are indicated by the letters "REF". "A/R" indicates that the item may be requisitioned "as required"; however, estimated minimum quantities may be stocked to cover immediate needs.
k. Direct Support Column. No parts authorized for stockage at this category.
l. General Support Column. This column indicates quantities of repair parts authorized for initial stockage for use in general support maintenance. The quantities are based on 100 equipments to be maintained for a 15-day period.
m. Depot Column. The numbers in this column indicate quantities of repair parts au-
thorized for depot maintenance and for initial stockage for maintenance, and for supply support to lower categories. The entries are based on the quantity required for rebuild of 100 equipments.
n. Illustrations Column.
(1) Figure number. This column lists the figure number used for the identification of the items in the illustration or text of the technical manual.
(2) Item Number. This column lists the item number used for the identification of the items in the illustration or text of the technial manual.
(3) Reference symbol. This column lists the reference symbols used for the identification of the items in the illustration or text of the technical manual.

## B-3. Parts for Maintenance

When this equipment is used for electronic service organizations organic to the theater headquarters or communication zones to provide theater communications, those repair parts authorized up to and including general support are authorized for stockage by the organization operating this equipment

## B-4. Requisitioning Information

$a$. The allowance factors are based on 100 equipments. In order to determine the number of parts authorized for initial stockage for the specific number of equipments supported, the following formula will be used and carried out to two decimal places.

Specific number of equipments supported allowance factor

$$
x-\frac{}{100}=
$$

Number of parts authorized for initial dockage.
b. Fractional values obtained from above computation will be rounded to whole numbers as follows :
(1) When the total number of parts authorized is less than 0.5 , the quantity authorized will be zero.
(2) When the total number of parts authorized is between 0.5 and 1.0 , the quantity authorized will be one.
(3) For all values above one, fractional values below 0.5 will revert to the next lower whole number and fractional value 0.5 and above will advance to the next higher whole number.
c. The quantities determined in accordance with the above computation represent the initial stockage for a 15-day period.

## B-5. Location of Repair Parts

Follow the procedures given in a through c below.
$a$. Use the table of contents to locate the appropriate appendix of the repair parts list.
$b$. If the figure number, item number and/ or reference designation is available, locate the item by scrutiny of columns 14,15 , and/or 16 of the repair parts list.
$c$. If the figure number, item number and/ or reference designation is not known, check the description column (column 6) in the repair parts list to locate the part.

## This fine document...

Was brought to you by me:

## Liberated Manuals -- free army and government manuals

Why do I do it? I am tired of sleazy CD-ROM sellers, who take publicly available information, slap "watermarks" and other junk on it, and sell it. Those masters of search engine manipulation make sure that their sites that sell free information, come up first in search engines. They did not create it... They did not even scan it... Why should they get your money? Why are not letting you give those free manuals to your friends?

I am setting this document FREE. This document was made by the US Government and is NOT protected by Copyright. Feel free to share, republish, sell and so on.

I am not asking you for donations, fees or handouts. If you can, please provide a link to liberatedmanuals.com, so that free manuals come up first in search engines:
<A HREF=http://www.liberatedmanuals.com/>Free Military and Government Manuals</A>
