# **MODEL 2340**

# NSN 4933-01-018-9820

# **REPORTING ERRORS AND RECOMMENDING IMPROVEMENTS**

You can help improve this manual. If you find any mistakes or if you know of a way to improve the procedures, please let us know. Mail your letter, DA Form 2028 (Recommended Changes to Publications and Blank Forms), or DA Form 2028-2, located in the back of this manual direct to: Commander, US Army Armament Materiel Readiness Command, ATTN: DRSAR-MAS, Rock Island, IL 61299. A reply will be furnished directly to you.

## NOTE

This manual is published for the purpose of identifying an authorized commercial manual for the use of the personnel to whom this voltmeter is issued.

Manufactured by: General Microwave Corp. 155 Marine St. Farmingdale, NY 11735

Procured under Contract No. DAAA09-79C-4621

This technical manual is an authentication of the manufacturers' commercial literature and does not conform with the format and content specified in AR 310-3, Military Publications. This technical manual does, however, contain available information that is essential to the operation and maintenance of the equipment.

# INSTRUCTIONS FOR REQUISITIONING PARTS

## NOT IDENTIFIED BY NSN

When requisitioning parts not identified by National Stock Number, it is mandatory that the following information be furnished the supply officer.

- 1 Manufacturer's Federal Supply Code Number <sup>11332</sup>
- 2 Manufacturer's Part Number exactly as listed herein.
- 3 Nomenclature exactly as listed herein, including dimensions, if necessary.
- 4 Manufacturer's Model Number Model 2340
- 5 Manufacturer's Serial Number (End Item)
- 6 Any other information such as Type, Frame Number, and Electrical Characteristics, if applicable.
- 7 If DD Form 1348 is used, fill in all blocks except 4, 5, 6, and Remarks field in accordance with AR 725-50.

Complete Form as Follows:

- (a) In blocks 4, 5, 6, list manufacturer's Federal Supply Code Number - 11332 followed by a colon and manufacturer's Part Number for the repair part.
- (b) Complete Remarks field as follows: Noun: (nomenclature of repair part) For: NSN: 4933-01-018-9820 Manufacturer: General Microwave Corp. 155 Marine Street Farmingdale, NY 11735 Model: 2340 Serial: (of end item)

Any other pertinent information such as Frame Number, Type, Dimensions, etc.

Figure 1. Digital Voltmeter Model 2340

#### 1. DESCRIPTION

Model 2340 Digital Voltmeter is a panel mounted unit that is designed to automatically measure 0 to  $\pm$  60 volts dc. The readout is shown on a 5-digit LED display. This manual contains information for operation, troubleshooting, repair, and parts list. Refer to Table 1 for a summary of the features and characteristics of the digital voltmeter. Appendix A provides the calibration procedure. This instrument does not require lubrication. Safety precautions and cleaning instructions are described in repair section 4.

#### 2. OPERATION

Apply primary dc power and input voltage. There are no external controls. After at least a five-minute warmup period, the following operation can be observed:

The value and polarity of input voltages in the range of 0 to 60.00 volts will be automaticall y displayed.

Inputs in the 0 to  $\pm 9.999$  volt range will be displayed to a resolution of .001 volt.

Inputs greater than  $\pm$  10.999 volts will be displayed to a resolution of .01 volt.

Inputs in the  $\pm 10.000$  to  $\pm 10.999$  volts range will be displayed to a resolution of either .001 volt, or .01 volt, depending on the automatically selected range.

#### 3. TROUBLESHOOTING

A detailed understanding of the unit block diagram (figure 3) and timing diagram (figure 4) is essential to troubleshooting the Model 2340. Study the material provided under Block Diagram Description and Timing, including the schematic (figure 5) before initiating troubleshooting procedures.

The flow diagram (figure 6) and test chart (table 2) are logical troubleshooting guides. Careful observation of the display, dc voltages, and waveforms will expedite isolation of a malfunction to a functional block. At that point, the unit schematic and the flow diagram are required to further localize and identify the cause of malfunction.

3.1 RECOMMENDED TEST EQUIPMENT The following test equipment (or equivalent) is required to implement the troubleshooting procedure.

QTY	DESCRIPTIO	N
1	Power Supply, LAMBDA DC Signal Standard, ANALO	LPD-422A-FM
1	DC Signal Standard, ANALO	GIC AN3100
1	Digital Multimeter, FLUKE	8000A
1	Oscilloscope, TEKTRONIX w/type W Plug-in	545A

8.2 BLOCK DIAGRAM (Figure 3) Model 2340 circuits are contained in three major subassemblies:

1. Dc power supply module 8656-P1 which converts input, unregulated, 22-30V dc to well-regulated +15 vdc, -15 vdc and +5 vdc outputs. 2. Analog pc board assembly 8661-G1 which contains all circuitry required by the voltmeter other than the counter chain, storage latches, and the 4-1/2 digit LED readout.

3. Counters and Digital Readout pc board assembly 8659-G1 which contains the 4-1/2 digit LED readout, 4decade counter chain, storage latches, BCD decoder drivers and LED current limiting resistor networks. (Note: This assembly interfaces with the other assemblies via a 20-pin plug-in integral connector which has its mating connector on the analog pc board assembly.)

Functionally the Model 2340 is a precision, dual-slope, A/D converter with a LED numeric readout. It includes autoranging circuits which route the signal directly to the input buffer or via a precise 10:1 voltage divider to the input buffer. Routing is determined by the reading in the counter circuits; if below 1,000, the signal goes directly to the buffer; if above 10,999, the signal is attenuated through the 10:1 divider.

The input power protection circuits prevent damage to the power supply module when a wrong polarity or a transient overvoltage is present at the dc power input.

To reduce the temperature extremes to which key thermally sensitive components are exposed, a heated enclosure is used on the analog pc board. A temperature sensor and controller applies power to several heating elements to keep the compartment from dropping below 30°C (approx).

#### 3.3 TIMING (Figure 4)

All timing measurements are referenced to the negative going output pulse of rate control oscillator U15. (The waveforms of figure 4 are typical for a positive input voltage measurement .)

The rate control pulse sets S/R flip-flop U11 to generate the INTEGRATE SIGNAL ENABLE which in turn sets a second S/R flip-flop (also part of U11) to provide the CLK ENABLE signal. While the CLK ENABLE is high, CLOCK pulses are generated from the clock circuit consisting of three inverters of U8 and R53 and C11. The clock frequency is primarily determined by the values of R53 and C11.

To establish initial conditions in the counter chain, consisting of decade counter integrated circuits U101 through U104, the CLAMP output of timer U15 (pin 7) is differentiated and coupled to Q14 to generate a narrow RESET pulse. After 8000 negative clock pulse transitions, the 8 digit from counter U104 goes high; after 2000 additional clock pulses the 8000 signal at U104 (pin 11) goes low. At that instant the output from one-half of J-K flip-flop U13 complements and the negative going edge of U13 (pin 13) is differentiated and applied to S/R flip-flop U12. This permits the integration of either the plus or minus reference voltage depending on the output of polarity flip-flop U14. Simultaneously, the negative going edge of the U13 (pin 13) output resets INTEGRATE SIGNAL flip-flop U11 to end the signal integration phase of the measurement.

Signal polarity is determined by sampling the comparator output level (U7 pin 7) at the end of the INTEGRATE SIGNAL phase of the measurement. The sampling pulse (POLARITY STROBE) is generated by differentiating the down going edge of U13 nin 13 and counling into inverter U8 (pin 5) Measured signal polarity is stored in J-K flipflop U14 by reading in the instantaneous logic levels applied to the J-K inputs during the POLARITY STROBE.

During the INTEGRATE SIGNAL period a charge is accumulated on integrator capacitor C2; during INTEGRATE REF that charge is reduced to zero by the appropriate reference voltage coupled through analog gates Q4 or Q5. When comparator U7 senses that the integrator has crossed through zero, the comparator output changes state and resets CLOCK ENABLE flip-flop U11 by gene ting a negative pulse at the output of U9. The negative going edge of the CLOCK ENABLE pulse is differentiated (R54 and C10) and coupled through Q11 to generate a positive strobe pulse for loading the counter outputs into storage latches U105 through U108. This positive strobe is also coupled through Q12 and delayed by C13 to generate the DELAYED STROBE pulse which transfers the overrange signal from one-half of flip-flop U13 into the second half of U13. The U13 output drives the most significant 1 in the LED readout when greater than 9999 clock pulses have been accumulated during the INTEGRATE REF phase of the measurement.

	Table 1.
ECTRICAL CHARACTERISTICS	SPECIFICATIONS
FULL SCALE RANGE:	Auto-ranging Low scale 0-±11.000V DC High scale 0-±110.00V DC
MAXIMUM ALLOWABLE INPUT:	500 V, AC or DC
RESOLUTION:	1 mV, low scale 10 mV, high scale
INPUT IMPEDANCE :	1 Megohm
CMV: (Common Mode Voltage)	±300 V DC (600 AC, P-P)
CMR: (Common Mode Rejection)	>100 dB, DC to 60 Hz
NMR: (Normal Mode Rejection)	>30 dB at 60 Hz
INPUT BIAS CURRENT:	25 nA Maximum
ACCURACY:	±0.04% reading ± 3 counts
STABILITY:	Specified accuracy applies over the full operating temperature range.
LONG TERM STABILITY :	Calibration not required more often than every six months
SETTLING TIME:	New reading appears each conversion cycle.
SAMPLE RATE:	Two per second
WARM UP TIME:	Five minutes to specified accuracy.
DISPLAY:	7 Segment LED, .27 in.
POLARITY INDICATION :	Automatic $+$ and $-$ symbols.
INPUT POWER :	22 to 30 V DC 18 watts max. at 28 V DC.
INPUT POWER PROTECTION:	To 32 V max. 2 minutes duration; to 80 V max. 100 msec duration; reverse polarity.
IYSICAL CHARACTERISTICS	
SIZE: (in inches)	<b>3.50H x 6.30W x 5.25D</b> (exclusive of connector) <b>See o</b> utline drawing, figure 2.
WEIGHT:	4.2 lb. max.
MATING CONNECTOR REQUIRED:	MS 3124 E-10-6S
CASEMATERIAL:	Aluminum alloy, black anodize finish.

SERVICE CONDITIONS	Table 1 (continued) SPECIFICATIONS
TEMPERATURE:	Per MIL-STD-810B Operating —40°C to 71°C Storage — 62°C to 85°C
HUMIDITY:	Per MIL-STD-810B, Method 507, Procedure I (to 95 percent RH)
VIBRATION:	Per MIL-STD-810B, Method 514-1, Procedure IX, Part 1.
SHOCK:	Per MIL-STD-810B, Method 516-1, Procedure I, Figure 516.1-1, Parameters b and d.
FUNGUS:	As specified in Table III of MIL-STD-810B, Method 508, Procedure I.
OPTIONAL VARIATIONS	
INPUT VOLTAGE	117V, <sup>±1</sup> 0%, 60-400 Hz
FULL SCALE RANGE	SINGLE RANGE 0-9.999V OR 0-99.99V

The DELAYED STROBE pulse is used in determining the measurement range and illuminating the correct decimal point. Application of the DELAYED STROBE pulse strobes a logic signal into J-K flip-flop U14 which is derived from logic which determines whether the count stored in the latches is less than 1000 or greater than 10,999. The range outputs of U14 actuate the appropriate auto-ranging relay (SPST) K1 or K2 for routing the signal directly to the input buffer or via a precise 10:1 voltage divider to the input buffer and to illuminate the display decimal point. The delay time is required to prevent timing problems which can result in readout errors.

Between measurements, that is the time during which the CLOCK ENABLE flip-flop is reset, a FET clamp circuit across integrator capacitor C2 is enabled, to prevent charge accumulation from various leakage and bias currents.

3.4 FLOW DIAGRAM AND TEST CHART (figure 6 and table 2).

The troubleshooting flow diagram provides a logical and systematic procedure for isolating malfunctions and locating defective components. Isolation of a malfunction will initially be to one of the major subassemblies, (1) Power Supply, (2) Analog Circuits and (3) Counters and Digital Readout.

The test chart is used in conjunction with the flow diagram and details each test listed in the diagram.

### 4. <u>REPAIR</u>

To gain access to the interior of a Model 2340 remove the two screws at the rear of the unit, the four screws on each side, and then carefully withdraw the panel-chassis assembly from the housing. Standard readily available components are used whenever possible in the manufacture of the Model 2340. Special or modified parts are identified in the parts list by GMC DWG number. Observe the usual precautions and good practices associated with replacing components in precision electronic equipment, such as:

#### CAUTION

(1) Before using any tool, electrostatically neutralize it by touching it to a large metallic mass or a known ground

#### CAUTION

(2) Make resistance scheck using the higher ohmmeter ranges only.

#### CAUTION

(3) To avoid damage to the printed circuit board, use a temperature-controlled 1/8 inch soldering iron set to 700° F whenever siblence if component replacement is required. The heat of etc soldering iron will permit the component to be removed through the conformal coating. After component replacement has been made, thoroughly remove all flux remains using a clean stiff brush dipped in Freon TMC<sup>1W</sup> solvent. Then permit a one-minute drying period and apply Humiseal 1B3 1<sup>TM</sup> coating using a second clean stiff brush. Allow a one hour curing period before calibrating the unit.

(4) If component replacement is required, be sure to use only the types described in the parts list.

APPENDIX A

MODEL 2340 DIGITAL VOLTMETER CALIBRATION PROCEDURE

# SECTION I

## IDENTIFICATION AND DESCRIPTION

1 . 1 IDENTIFICATION

Model 2340 Digital Voltmeter.

#### 1.2 CALIBRATION DESCRIPTION

TEST INSTRUMENT	PERFORMANCE
PARAMETERS	SPECIFICATIONS
Accuracy	±0.04% reading ±3 counts

1 . 3 FORMS AND RECORDS

Maintenance forms, records, and reports which are to be used by maintenance personnel at all maintenance levels are listed in and prescribed by TM 38-750.

## **SECTION 2**

## EQUIPMENT REQUIREMENTS

#### NOTE

Minimum use specifications are the principal parameters required for performance of the calibration, and are included to assist in the selection of alternate equipment, which may be used at the discretion of the calibrating activity. Satisfactory performance of alternate items shall be verified prior to use. All applicable equipment must bear evidence of current calibration.

ITEM	MINIMUM USE SPECIFICATIONS	CALIBRATION EQUIPMENT <sup>1</sup>
Voltage Standard	0 to 11.11110 volts Accuracy ± .01% of reading	ANALOGIC AN3100
DC Power Supply	18 to 32 volts @ 700mA (max)	LAMBDA LPD-422A-FM

<sup>1</sup>The calibration equipment utilized in this procedure was selected from those known to be available at Department of Defense facilities, and the listing by make or model number carries no implication of preference, recommendation, or approval by the Department of Defense for use by other agencies. It is recognized that equivalent equipment produced by other manufacturers may be capable of equally satisfactory performance in the procedure.

## SECTION III

## PRELIMINARY OPERATION

Refer to Model 2340 DVM Technical Manual for familiarization with general operating procedures before beginning calibration.

## SECTION IV

## CALIBRATION PROCESS

## NOTE

Unless otherwise specified, verify the results of each test and take corrective action whenever the test requirement is not met, before proceeding.

## 4 . 1 INTERCONNECTION

Connections for the calibration process are described at the appropriate point in the procedure. Connector pin assignments are:

PIN	PURPOSE		
Α	Signal Input High		
В	Signal Input Low		
С	+28V DC, 620mA max		
D	+28V Return (chassis)		
Е	Spare		
F	Spare		

4 . 2 ACCURACY CHECKS

 $_{\rm 4.2.1.}$  Apply DC voltage input within the range of 22 to 30 volts between pins J1-C(+) and J1-D(-). Allow a 5 minute warmup.

4.2.2. Apply calibrated input signals between pins J1-A(high) and J1-B(ground) in accordance with Table 4-1 Column (3) and check that display readout is within the calibration tolerances of column (7).

4 3 CALIBRATION ADJUSTMENT

#### NOTE

Do not take corrective action until step 4.3.5 has been performed.

4.3.1. Apply a DC signal of +4.5 mV between pins J1-A(+) and J1-B(-). Adjust R24 as required for a +0.005 display reading.

 $_{\rm 4.3.2.}$  Adjust DC signal for -4.5 mV and adjust R24 as required for a -0.005 display reading.

 $_{\rm 4.3.3.}$  Adjust DC signal for -10.0005 volts and note absolute value of display reading.

4.3.4. Adjust DC signal for +10.0005 volts and adjust R21 as required to obtain exact value noted in step 4.3.3.

4.3.5. Repeat steps 4.3.1. through 4.3.4. until no further adjustments are required.

4.3.6. Adjust DC signal input for +10.0005 volts and adjust R11 as required for a display indication of +10.001.

 $_{\rm 4.3.7.}$  Apply glyptal to R11, R21 and R24 adjustment screws.

## TM 9-4933-241-14&P — VOLTMETER, DIGITAL — 1981

This fine document...

Was brought to you by me:

## Liberated Manuals -- free army and government manuals

Why do I do it? I am tired of sleazy CD-ROM sellers, who take publicly available information, slap "watermarks" and other junk on it, and sell it. Those masters of search engine manipulation make sure that their sites that sell free information, come up first in search engines. They did not create it... They did not even scan it... Why should they get your money? Why are not letting you give those free manuals to your friends?

I am setting this document FREE. This document was made by the US Government and is NOT protected by Copyright. Feel free to share, republish, sell and so on.

I am not asking you for donations, fees or handouts. If you can, please provide a link to liberatedmanuals.com, so that free manuals come up first in search engines:

<A HREF=<u>http://www.liberatedmanuals.com/</u>>Free Military and Government Manuals</A>

Sincerely
 Igor Chudov
